Intel® Arria® 10 Device Datasheet

This datasheet describes the electrical characteristics, switching characteristics, configuration specifications, and I/O timing for Intel® Arria® 10 devices.

Intel Arria 10 devices are offered in extended and industrial grades. Extended devices are offered in -E1 (fastest), -E2, and -E3 speed grades. Industrial grade devices are offered in the -I1, -I2, and -I3 speed grades.

The suffix after the speed grade denotes the power options offered in Intel Arria 10 devices.

- L—enables the device to operate at low static power while maintaining excellent performance.
- S—standard power specification.
- V—enables the device to run at lower than default V_{CC} , reducing static and dynamic power while retaining equivalent performance.
- H—small device with high performance at the fastest speed grade (-1).

Electrical Characteristics

The following sections describe the operating conditions and power consumption of Intel Arria 10 devices.

Operating Conditions

Intel Arria 10 devices are rated according to a set of defined parameters. To maintain the highest possible performance and reliability of the Intel Arria 10 devices, you must consider the operating requirements described in this section.

Absolute Maximum Ratings

This section defines the maximum operating conditions for Intel Arria 10 devices. The values are based on experiments conducted with the devices and theoretical modeling of breakdown and damage mechanisms. The functional operation of the device is not implied for these conditions.

Caution: Conditions outside the range listed in the following table may cause permanent damage to the device. Additionally, device operation at the absolute maximum ratings for extended periods of time may have adverse effects on the device.

Table 1. Absolute Maximum Ratings for Intel Arria 10 Devices

| Symbol | Description | Condition | Minimum | Maximum | Unit |
|--------------------------|--|-----------|---------|---------|------|
| V _{CC} | Core voltage power supply | — | -0.50 | 1.21 | V |
| V _{CCP} | Periphery circuitry and transceiver fabric interface power supply | — | -0.50 | 1.21 | V |
| V _{CCERAM} | Embedded memory power supply | — | -0.50 | 1.36 | V |
| V _{CCPT} | Power supply for programmable power technology and I/O pre-driver | — | -0.50 | 2.46 | V |
| V _{CCBAT} | Battery back-up power supply for design security volatile key register | — | -0.50 | 2.46 | V |
| V _{CCPGM} | Configuration pins power supply | (1) | -0.50 | 2.46 | V |
| V _{CCIO} | I/O buffers power supply | 3 V I/O | -0.50 | 4.10 | V |
| | | LVDS I/O | -0.50 | 2.46 | V |
| V _{CCA_PLL} | Phase-locked loop (PLL) analog power supply | — | -0.50 | 2.46 | V |
| V _{CCT_GXB} | Transmitter power supply | — | -0.50 | 1.34 | V |
| V _{CCR_GXB} | Receiver power supply | — | -0.50 | 1.34 | V |
| V _{CCH_GXB} | Transceiver output buffer power supply | — | -0.50 | 2.46 | V |
| V _{CCL_HPS} | HPS core voltage and periphery circuitry power supply | — | -0.50 | 1.27 | V |
| V _{CCIO_HPS} | HPS I/O buffers power supply | 3 V I/O | -0.50 | 4.10 | V |
| | | LVDS I/O | -0.50 | 2.46 | V |
| V _{CCIOREF_HPS} | HPS I/O pre-driver power supply | — | -0.50 | 2.46 | V |

continued...

(1) The LVDS I/O values are applicable to all dedicated and dual-function configuration I/Os.

| Symbol | Description | Condition | Minimum | Maximum | Unit |
|------------------------|--------------------------------|-----------|--------------------------------|---------|------|
| V _{CCPLL_HPS} | HPS PLL power supply | — | -0.50 | 2.46 | V |
| I _{OUT} | DC output current per pin | — | -25 ⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾⁽⁶⁾ | 25 | mA |
| T _J | Operating junction temperature | — | -55 | 125 | °C |
| T _{STG} | Storage temperature (no bias) | — | -65 | 150 | °C |

Maximum Allowed Overshoot and Undershoot Voltage

During transitions, input signals may overshoot to the voltage listed in the following table and undershoot to -2.0 V for input currents less than 100 mA and periods shorter than 20 ns.

The maximum allowed overshoot duration is specified as a percentage of high time over the lifetime of the device. A DC signal is equivalent to 100% duty cycle.

For example, a signal that overshoots to 2.70 V for LVDS I/O can only be at 2.70 V for ~4% over the lifetime of the device.

-
- (2) The maximum current allowed through any LVDS I/O bank pin when the device is not turned on or during power-up/power-down conditions is 10 mA.
 - (3) Total current per LVDS I/O bank must not exceed 100 mA.
 - (4) Voltage level must not exceed 1.89 V.
 - (5) Applies to all I/O standards and settings supported by LVDS I/O banks, including single-ended and differential I/Os.
 - (6) Applies only to LVDS I/O banks. 3 V I/O banks are not covered under this specification and must be implemented as per the power sequencing requirement. For more details, refer to *AN 692: Power Sequencing Considerations for Intel Cyclone® 10 GX, Intel Arria 10, and Intel Stratix® 10 Devices* and *Power Management in Intel Arria 10 Devices chapter*.

Table 2. Maximum Allowed Overshoot During Transitions for Intel Arria 10 Devices

This table lists the maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage of device lifetime. The LVDS I/O values are applicable to the VREFP_ADC and VREFN_ADC I/O pins.

| Symbol | Description | Condition (V) | | Overshoot Duration as % at T _J = 100°C | Unit |
|---------|------------------|-------------------------|---------|---|------|
| | | LVDS I/O ⁽⁷⁾ | 3 V I/O | | |
| Vi (AC) | AC input voltage | 2.50 | 3.80 | 100 | % |
| | | 2.55 | 3.85 | 42 | % |
| | | 2.60 | 3.90 | 18 | % |
| | | 2.65 | 3.95 | 9 | % |
| | | 2.70 | 4.00 | 4 | % |
| | | > 2.70 | > 4.00 | No overshoot allowed | % |

For an overshoot of 2.5 V, the percentage of high time for the overshoot can be as high as 100% over a 10-year period. Percentage of high time is calculated as $([\Delta T]/T) \times 100$. This 10-year period assumes that the device is always turned on with 100% I/O toggle rate and 50% duty cycle signal.

⁽⁷⁾ The LVDS I/O values are applicable to all dedicated and dual-function configuration I/Os.

Figure 1. Intel Arria 10 Devices Overshoot Duration

Recommended Operating Conditions

This section lists the functional operation limits for the AC and DC parameters for Intel Arria 10 devices.

Recommended Operating Conditions

Table 3. Recommended Operating Conditions for Intel Arria 10 Devices

This table lists the steady-state voltage values expected from Intel Arria 10 devices. Power supply ramps must all be strictly monotonic, without plateaus.

| Symbol | Description | Condition | Minimum ⁽⁸⁾ | Typical | Maximum ⁽⁸⁾ | Unit |
|------------------------------------|---|---------------------------------------|------------------------|---------|------------------------|------|
| V _{CC} | Core voltage power supply | Standard and low power ⁽⁹⁾ | 0.87 | 0.9 | 0.93 | V |
| | | | 0.92 | 0.95 | 0.98 | V |
| | | SmartVID ⁽¹⁰⁾ | 0.82 | — | 0.93 | V |
| V _{CCP} | Periphery circuitry and transceiver fabric interface power supply | Standard and low power ⁽⁹⁾ | 0.87 | 0.9 | 0.93 | V |
| | | | 0.92 | 0.95 | 0.98 | V |
| | | SmartVID ⁽¹⁰⁾ | 0.82 | — | 0.93 | V |
| V _{CCPGM} | Configuration pins power supply | 1.8 V | 1.71 | 1.8 | 1.89 | V |
| | | 1.5 V | 1.425 | 1.5 | 1.575 | V |
| | | 1.2 V | 1.14 | 1.2 | 1.26 | V |
| V _{CCERAM} | Embedded memory power supply | 0.9 V ⁽⁹⁾ | 0.87 | 0.9 | 0.93 | V |
| | | 0.95 V ⁽⁹⁾ | 0.92 | 0.95 | 0.98 | V |
| V _{CCBAT} ⁽¹¹⁾ | Battery back-up power supply (For design security volatile key register) | — | 1.14 | — | 1.89 | V |

continued...

- ⁽⁸⁾ This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.
- ⁽⁹⁾ You can operate –1 and –2 speed grade devices at 0.9 V or 0.95 V typical value. You can operate –3 speed grade device only at 0.9 V typical value. Operating at 0.95 V results in higher core performance and higher power consumption. Refer to core performance in this datasheet for different typical values. For more information about the power consumption of different typical values, refer to the Intel Quartus® Prime software, Power Analyzer report, and Early Power Estimator (EPE).
- ⁽¹⁰⁾ SmartVID is supported in devices with –3V speed grades only.
- ⁽¹¹⁾ If you do not use the design security feature in Intel Arria 10 devices, connect V_{CCBAT} to a 1.5-V to 1.8-V power supply. Intel Arria 10 power-on reset (POR) circuitry monitors V_{CCBAT}. Intel Arria 10 devices do not exit POR if V_{CCBAT} is not powered up.

| Symbol | Description | Condition | Minimum ⁽⁸⁾ | Typical | Maximum ⁽⁸⁾ | Unit |
|------------------------------------|---|--------------------------|------------------------|---------|------------------------|------|
| V _{CCPT} | Power supply for programmable power technology and I/O pre-driver | 1.8 V | 1.71 | 1.8 | 1.89 | V |
| V _{CCIO} | I/O buffers power supply | 3.0 V (for 3 V I/O only) | 2.85 | 3.0 | 3.15 | V |
| | | 2.5 V (for 3 V I/O only) | 2.375 | 2.5 | 2.625 | V |
| | | 1.8 V | 1.71 | 1.8 | 1.89 | V |
| | | 1.5 V | 1.425 | 1.5 | 1.575 | V |
| | | 1.35 V | (12) | 1.35 | (12) | V |
| | | 1.25 V | 1.19 | 1.25 | 1.31 | V |
| | | 1.2 V | (12) | 1.2 | (12) | V |
| V _{CCA_PLL} | PLL analog voltage regulator power supply | — | 1.71 | 1.8 | 1.89 | V |
| V _{REFP_ADC} | Precision voltage reference for voltage sensor | — | 1.2475 | 1.25 | 1.2525 | V |
| V _I ⁽¹³⁾⁽¹⁴⁾ | DC input voltage | 3 V I/O | -0.3 | — | 3.3 | V |
| | | LVDS I/O | -0.3 | — | 2.19 | V |
| V _O | Output voltage | — | 0 | — | V _{CCIO} | V |
| T _J | Operating junction temperature | Extended | 0 | — | 100 | °C |

continued...

⁽⁸⁾ This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

⁽¹²⁾ For minimum and maximum voltage values, refer to the I/O Standard Specifications section.

⁽¹³⁾ The LVDS I/O values are applicable to all dedicated and dual-function configuration I/Os.

⁽¹⁴⁾ This value applies to both input and tri-stated output configuration. Pin voltage should not be externally pulled higher than the maximum value.

| Symbol | Description | Condition | Minimum ⁽⁸⁾ | Typical | Maximum ⁽⁸⁾ | Unit |
|-----------------------------------|------------------------|--------------|------------------------|---------|------------------------|------|
| | | Industrial | -40 | — | 100 | °C |
| t _{RAMP} ⁽¹⁵⁾ | Power supply ramp time | Standard POR | 200 μs | — | 100 ms | — |
| | | Fast POR | 200 μs | — | 4 ms | — |

Transceiver Power Supply Operating Conditions

Table 4. Transceiver Power Supply Operating Conditions for Intel Arria 10 GX/SX Devices

| Symbol | Description | Condition ⁽¹⁶⁾ | Minimum ⁽¹⁷⁾ | Typical | Maximum ⁽¹⁷⁾ | Unit |
|---|--------------------------|---|-------------------------|---------|-------------------------|------|
| V _{CCT_GXB} [L1,R4] [C, D, E, F, G, H, I, J] ⁽¹⁸⁾ | Transmitter power supply | Chip-to-Chip ≤ 17.4 Gbps Or Backplane ⁽¹⁹⁾ ≤ 12.5 Gbps | 1.0 | 1.03 | 1.06 | V |
| | | Chip-to-Chip ≤ 11.3 Gbps | 0.92 | 0.95 | 0.98 | V |
| <i>continued...</i> | | | | | | |

⁽⁸⁾ This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

⁽¹⁵⁾ t_{ramp} is the ramp time of each individual power supply, not the ramp time of all combined power supplies.

⁽¹⁶⁾ These data rate ranges vary depending on the transceiver speed grade. Refer to Transceiver Performance for Intel Arria 10 GX/SX Devices for exact data rate ranges.

⁽¹⁷⁾ This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

⁽¹⁸⁾ To support PCIe* Gen3, this pin must be 1.03 V (± 30 mV) or higher.

⁽¹⁹⁾ Backplane applications assume advanced equalization circuitry, such as decision feedback equalization (DFE), is enabled to compensate for signal impairments. Chip-to-chip links are assumed to be applications with short reach channels that do not require DFE.

| Symbol | Description | Condition ⁽¹⁶⁾ | Minimum ⁽¹⁷⁾ | Typical | Maximum ⁽¹⁷⁾ | Unit |
|---|--|---|-------------------------|---------|-------------------------|------|
| V _{CCR_GXB} [L1,R4] [C, D, E, F, G, H, I, J] ⁽¹⁸⁾ | Receiver power supply | Chip-to-Chip ≤ 17.4 Gbps Or Backplane ⁽¹⁹⁾ ≤ 12.5 Gbps | 1.0 | 1.03 | 1.06 | V |
| | | Chip-to-Chip ≤ 11.3 Gbps | 0.92 | 0.95 | 0.98 | V |
| V _{CCH_GXB} [L,R] | Transceiver output buffer power supply | — | 1.710 | 1.8 | 1.890 | V |

Note: Most V_{CCR_GXB} and V_{CCT_GXB} pins associated with unused transceiver channels can be grounded on a per-side basis to minimize power consumption. Refer to the *Intel Arria 10 GX, GT, and SX Device Family Pin Connection Guidelines* and the Intel Quartus Prime pin report for information about pinning out the package to minimize power consumption for your specific design.

Table 5. Transceiver Power Supply Operating Conditions for Intel Arria 10 GT Devices

| Symbol | Description | Condition ⁽²⁰⁾ | Minimum ⁽¹⁷⁾ | Typical | Maximum ⁽¹⁷⁾ | Unit |
|----------------------------|--------------------------|---|-------------------------|---------|-------------------------|------|
| V _{CCT_GXB} [L,R] | Transmitter power supply | Chip-to-Chip ≤ 25.8 Gbps ⁽²¹⁾ Or Backplane ⁽¹⁹⁾ ≤ 12.5 Gbps | 1.10 | 1.12 | 1.14 | V |
| | | Chip-to-Chip ≤ 15 Gbps Or Backplane ⁽¹⁹⁾ ≤ 12.5 Gbps | 1.0 | 1.03 | 1.06 | V |
| | | Chip-to-Chip ≤ 11.3 Gbps | 0.92 | 0.95 | 0.98 | V |

continued...

- ⁽¹⁶⁾ These data rate ranges vary depending on the transceiver speed grade. Refer to Transceiver Performance for Intel Arria 10 GX/SX Devices for exact data rate ranges.
- ⁽¹⁷⁾ This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.
- ⁽²⁰⁾ These data rate ranges vary depending on the transceiver speed grade. Refer to Transceiver Performance for Intel Arria 10 GT Devices table for exact data rate ranges.
- ⁽²¹⁾ 25.8 Gbps is the maximum data rate for GT channels. 17.4 Gbps is the maximum data rate for GX channels.

| Symbol | Description | Condition ⁽²⁰⁾ | Minimum ⁽¹⁷⁾ | Typical | Maximum ⁽¹⁷⁾ | Unit |
|---------------------------|--|---|-------------------------|---------|-------------------------|------|
| V _{CCR_GXB[L,R]} | Receiver power supply | Chip-to-Chip ≤ 25.8 Gbps Or Backplane ⁽¹⁹⁾ ≤ 12.5 Gbps | 1.10 | 1.12 | 1.14 | V |
| | | Chip-to-Chip ≤ 15 Gbps Or Backplane ⁽¹⁹⁾ ≤ 12.5 Gbps | 1.0 | 1.03 | 1.06 | V |
| | | Chip-to-Chip ≤ 11.3 Gbps | 0.92 | 0.95 | 0.98 | V |
| V _{CCH_GXB[L,R]} | Transceiver output buffer power supply | — | 1.710 | 1.8 | 1.890 | V |

HPS Power Supply Operating Conditions

Table 6. HPS Power Supply Operating Conditions for Intel Arria 10 SX Devices

This table lists the steady-state voltage and current values expected from Intel Arria 10 system-on-a-chip (SoC) devices with ARM*-based hard processor system (HPS). Power supply ramps must all be strictly monotonic, without plateaus. Refer to Recommended Operating Conditions for Intel Arria 10 Devices table for the steady-state voltage values expected from the FPGA portion of the Intel Arria 10 SoC devices.

| Symbol | Description | Condition | Minimum ⁽²²⁾ | Typical | Maximum ⁽²²⁾ | Unit |
|--------------------------|---|------------------------|-------------------------|---------|-------------------------|------|
| V _{CCL_HPS} | HPS core voltage and periphery circuitry power supply | 0.9 V ⁽²³⁾ | 0.87 | 0.9 | 0.93 | V |
| | | 0.95 V ⁽²³⁾ | 0.92 | 0.95 | 0.98 | V |
| V _{CCIO_HPS} | HPS I/O buffers power supply | 3.0 V | 2.85 | 3.0 | 3.15 | V |
| | | 2.5 V | 2.375 | 2.5 | 2.625 | V |
| | | 1.8 V | 1.71 | 1.8 | 1.89 | V |
| V _{CCIOREF_HPS} | HPS I/O pre-driver power supply | — | 1.71 | 1.8 | 1.89 | V |

DC Characteristics

Supply Current and Power Consumption

Intel offers two ways to estimate power for your design—the Excel-based Early Power Estimator (EPE) and the Intel Quartus Prime Power Analyzer feature.

⁽²²⁾ This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

⁽²³⁾ V_{CCL_HPS} options are valid under the operating conditions specified in the Maximum HPS Clock Frequencies table.

Use the Excel-based EPE before you start your design to estimate the supply current for your design. The EPE provides a magnitude estimate of the device power because these currents vary greatly with the usage of the resources.

The Intel Quartus Prime Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yield very accurate power estimates.

I/O Pin Leakage Current

Table 7. I/O Pin Leakage Current for Intel Arria 10 Devices

If $V_O = V_{CCIO}$ to $V_{CCIO_{MAX}}$, 300 μA of leakage current per I/O is expected.

| Symbol | Description | Condition | Min | Max | Unit |
|----------|--------------------|---------------------------------|-----|-----|---------|
| I_I | Input pin | $V_I = 0 V$ to $V_{CCIO_{MAX}}$ | -80 | 80 | μA |
| I_{OZ} | Tri-stated I/O pin | $V_O = 0 V$ to $V_{CCIO_{MAX}}$ | -80 | 80 | μA |

Bus Hold Specifications

The bus-hold trip points are based on calculated input voltages from the JEDEC* standard.

Table 8. Bus Hold Parameters for Intel Arria 10 Devices

| Parameter | Symbol | Condition | V _{CCIO} (V) | | | | | | | | | | Unit |
|------------------------------------|-------------------|---|---|------|--|------|--|------|------|------|-----|------|------|
| | | | 1.2 | | 1.5 | | 1.8 | | 2.5 | | 3.0 | | |
| | | | Min | Max | Min | Max | Min | Max | Min | Max | Min | Max | |
| Bus-hold, low, sustaining current | I _{SUSL} | V _{IN} > V _{IL} (max) | 8 ⁽²⁴⁾ , 26 ⁽²⁵⁾ | — | 12 ⁽²⁴⁾ , 32 ⁽²⁵⁾ | — | 30 ⁽²⁴⁾ , 55 ⁽²⁵⁾ | — | 60 | — | 70 | — | μA |
| Bus-hold, high, sustaining current | I _{SUSH} | V _{IN} < V _{IH} (min) | -8 ⁽²⁴⁾ , -26 ⁽²⁵⁾ | — | -12 ⁽²⁴⁾ , -32 ⁽²⁵⁾ | — | -30 ⁽²⁴⁾ , -55 ⁽²⁵⁾ | — | -60 | — | -70 | — | μA |
| Bus-hold, low, overdrive current | I _{ODL} | 0 V < V _{IN} < V _{CCIO} | — | 125 | — | 175 | — | 200 | — | 300 | — | 500 | μA |
| Bus-hold, high, overdrive current | I _{ODH} | 0 V < V _{IN} < V _{CCIO} | — | -125 | — | -175 | — | -200 | — | -300 | — | -500 | μA |
| Bus-hold trip point | V _{TRIP} | — | 0.3 | 0.9 | 0.38 | 1.13 | 0.68 | 1.07 | 0.70 | 1.7 | 0.8 | 2 | V |

OCT Calibration Accuracy Specifications

If you enable on-chip termination (OCT) calibration, calibration is automatically performed at power up for I/Os connected to the calibration block.

(24) This value is only applicable for LVDS I/O bank.

(25) This value is only applicable for 3 V I/O bank.

Table 9. OCT Calibration Accuracy Specifications for Intel Arria 10 Devices

Calibration accuracy for the calibrated on-chip series termination (R_S OCT) and on-chip parallel termination (R_T OCT) are applicable at the moment of calibration. When process, voltage, and temperature (PVT) conditions change after calibration, the tolerance may change.

| Symbol | Description | Condition (V) | Resistance Tolerance | | | Unit |
|--|---|-----------------------------------|----------------------|------------|------------|------|
| | | | -E1, -I1 | -E2, -I2 | -E3, -I3 | |
| 25- Ω and 50- Ω R_S | Internal series termination with calibration (25- Ω and 50- Ω setting) | $V_{CCIO} = 1.8, 1.5, 1.2$ | ± 15 | ± 15 | ± 15 | % |
| 34- Ω and 40- Ω R_S | Internal series termination with calibration (34- Ω and 40- Ω setting) | $V_{CCIO} = 1.5, 1.25, 1.2$ | ± 15 | ± 15 | ± 15 | % |
| | | $V_{CCIO} = 1.35$ | ± 20 | ± 20 | ± 20 | % |
| 48- Ω , 60- Ω , 80- Ω , and 120- Ω R_S | Internal series termination with calibration (48- Ω , 60- Ω , 80- Ω , and 120- Ω setting) | $V_{CCIO} = 1.2$ | ± 15 | ± 15 | ± 15 | % |
| 240- Ω R_S | Internal series termination with calibration (240- Ω setting) | $V_{CCIO} = 1.2$ | ± 20 | ± 20 | ± 20 | % |
| 30- Ω R_T | Internal parallel termination with calibration (30- Ω setting) | $V_{CCIO} = 1.5, 1.35, 1.25$ | -10 to +40 | -10 to +40 | -10 to +40 | % |
| 34- Ω , 48- Ω , 80- Ω , and 240- Ω R_T | Internal parallel termination with calibration (34- Ω , 48- Ω , 80- Ω , and 240- Ω setting) | $V_{CCIO} = 1.2$ | ± 15 | ± 15 | ± 15 | % |
| 40- Ω , 60- Ω , and 120- Ω R_T | Internal parallel termination with calibration (40- Ω , 60- Ω , and 120- Ω setting) | $V_{CCIO} = 1.5, 1.35, 1.25, 1.2$ | -10 to +40 | -10 to +40 | -10 to +40 | % |
| | | $V_{CCIO} = 1.2$ ⁽²⁶⁾ | ± 15 | ± 15 | ± 15 | % |
| 80- Ω R_T | Internal parallel termination with calibration (80- Ω setting) | $V_{CCIO} = 1.2$ | ± 15 | ± 15 | ± 15 | % |

(26) Only applicable to POD12 I/O standard.

OCT Without Calibration Resistance Tolerance Specifications

Table 10. OCT Without Calibration Resistance Tolerance Specifications for Intel Arria 10 Devices

This table lists the Intel Arria 10 OCT without calibration resistance tolerance to PVT changes.

| Symbol | Description | Condition (V) | Resistance Tolerance | | | Unit |
|------------------------------|---|--|----------------------|----------|----------|------|
| | | | -E1, -I1 | -E2, -I2 | -E3, -I3 | |
| 25-Ω and 50-Ω R _S | Internal series termination without calibration (25-Ω and 50-Ω setting) | V _{CCIO} = 3.0, 2.5 | -40 to +30 | ± 40 | ± 40 | % |
| | | V _{CCIO} = 1.8, 1.5, 1.2 | -50 to +30 | ± 50 | ± 50 | % |
| 34-Ω and 40-Ω R _S | Internal series termination without calibration (34-Ω and 40-Ω setting) | V _{CCIO} = 1.5, 1.35, 1.25, 1.2 | -50 to +30 | ± 50 | ± 50 | % |
| 48-Ω and 60-Ω R _S | Internal series termination without calibration (48-Ω and 60-Ω setting) | V _{CCIO} = 1.2 | -50 to +30 | ± 50 | ± 50 | % |
| 120-Ω R _S | Internal series termination without calibration (120-Ω setting) | V _{CCIO} = 1.2 | -50 to +30 | ± 50 | ± 50 | % |
| 100-Ω R _D | Internal differential termination (100-Ω setting) | V _{CCIO} = 1.8 | ± 25 | ± 35 | ± 40 | % |

Pin Capacitance

Table 11. Pin Capacitance for Intel Arria 10 Devices

| Symbol | Description | Maximum | Unit |
|------------------------|--|---------|------|
| C _{IO_COLUMN} | Input capacitance on column I/O pins | 2.5 | pF |
| C _{OUTFB} | Input capacitance on dual-purpose clock output/feedback pins | 2.5 | pF |

Internal Weak Pull-Up and Weak Pull-Down Resistor

All I/O pins, except configuration, test, and JTAG pins, have an option to enable weak pull-up. The weak pull-down feature is only available for the pins as described in the Internal Weak Pull-Down Resistor Values for Intel Arria 10 Devices table.

Table 12. Internal Weak Pull-Up Resistor Values for Intel Arria 10 Devices

| Symbol | Description | Condition (V) ⁽²⁷⁾ | Value ⁽²⁸⁾ | Unit |
|-----------------|---|-------------------------------|-----------------------|------|
| R _{PU} | Value of the I/O pin pull-up resistor before and during configuration, as well as user mode if you have enabled the programmable pull-up resistor option. | V _{CCIO} = 3.0 ±5% | 25 | kΩ |
| | | V _{CCIO} = 2.5 ±5% | 25 | kΩ |
| | | V _{CCIO} = 1.8 ±5% | 25 | kΩ |
| | | V _{CCIO} = 1.5 ±5% | 25 | kΩ |
| | | V _{CCIO} = 1.35 ±5% | 25 | kΩ |
| | | V _{CCIO} = 1.25 ±5% | 25 | kΩ |
| | | V _{CCIO} = 1.2 ±5% | 25 | kΩ |

Table 13. Internal Weak Pull-Down Resistor Values for Intel Arria 10 Devices

| Pin Name | Description | Condition (V) | Value ⁽²⁸⁾ | Unit |
|------------|---|-------------------------------|-----------------------|------|
| nIO_PULLUP | Dedicated input pin that determines the internal pull-ups on user I/O pins and dual-purpose I/O pins. | V _{CC} = 0.9 ±3.33% | 25 | kΩ |
| TCK | Dedicated JTAG test clock input pin. | V _{CCPGM} = 1.8 ±5 % | 25 | kΩ |
| | | V _{CCPGM} = 1.5 ±5% | 25 | kΩ |
| | | V _{CCPGM} = 1.2 ±5% | 25 | kΩ |
| MSEL[0:2] | Configuration input pins that set the configuration scheme for the FPGA device. | V _{CCPGM} = 1.8 ±5% | 25 | kΩ |
| | | V _{CCPGM} = 1.5 ±5% | 25 | kΩ |
| | | V _{CCPGM} = 1.2 ±5% | 25 | kΩ |

Related Information

[Intel Arria 10 GX, GT, and SX Device Family Pin Connection Guidelines](#)

Provides more information about the pins that support internal weak pull-up and internal weak pull-down features.

⁽²⁷⁾ Pin pull-up resistance values may be lower if an external source drives the pin higher than V_{CCIO}.

⁽²⁸⁾ Valid with ±25% tolerances to cover changes over PVT.

I/O Standard Specifications

Tables in this section list the input voltage (V_{IH} and V_{IL}), output voltage (V_{OH} and V_{OL}), and current drive characteristics (I_{OH} and I_{OL}) for various I/O standards supported by Intel Arria 10 devices.

For minimum voltage values, use the minimum V_{CCIO} values. For maximum voltage values, use the maximum V_{CCIO} values.

You must perform timing closure analysis to determine the maximum achievable frequency for general purpose I/O standards.

[Recommended Operating Conditions](#) on page 8

Single-Ended I/O Standards Specifications

Table 14. Single-Ended I/O Standards Specifications for Intel Arria 10 Devices

| I/O Standard | V_{CCIO} (V) | | | V_{IL} (V) | | V_{IH} (V) | | V_{OL} (V) | V_{OH} (V) | $I_{OL}^{(29)}$ (mA) | $I_{OH}^{(29)}$ (mA) |
|--------------|----------------|-----|-------|--------------|------------------------|------------------------|------------------|------------------------|------------------------|-------------------------|-------------------------|
| | Min | Typ | Max | Min | Max | Min | Max | Max | Min | | |
| 3.0-V LVTTTL | 2.85 | 3 | 3.15 | -0.3 | 0.8 | 1.7 | 3.3 | 0.4 | 2.4 | 2 | -2 |
| 3.0-V LVCMOS | 2.85 | 3 | 3.15 | -0.3 | 0.8 | 1.7 | 3.3 | 0.2 | $V_{CCIO} - 0.2$ | 0.1 | -0.1 |
| 2.5 V | 2.375 | 2.5 | 2.625 | -0.3 | 0.7 | 1.7 | 3.3 | 0.4 | 2 | 1 | -1 |
| 1.8 V | 1.71 | 1.8 | 1.89 | -0.3 | $0.35 \times V_{CCIO}$ | $0.65 \times V_{CCIO}$ | $V_{CCIO} + 0.3$ | 0.45 | $V_{CCIO} - 0.45$ | 2 | -2 |
| 1.5 V | 1.425 | 1.5 | 1.575 | -0.3 | $0.35 \times V_{CCIO}$ | $0.65 \times V_{CCIO}$ | $V_{CCIO} + 0.3$ | $0.25 \times V_{CCIO}$ | $0.75 \times V_{CCIO}$ | 2 | -2 |
| 1.2 V | 1.14 | 1.2 | 1.26 | -0.3 | $0.35 \times V_{CCIO}$ | $0.65 \times V_{CCIO}$ | $V_{CCIO} + 0.3$ | $0.25 \times V_{CCIO}$ | $0.75 \times V_{CCIO}$ | 2 | -2 |

⁽²⁹⁾ To meet the I_{OL} and I_{OH} specifications, you must set the current strength settings accordingly. For example, to meet the 3.0-V LVTTTL specification (2 mA), you should set the current strength settings to 2 mA. Setting at lower current strength may not meet the I_{OL} and I_{OH} specifications in the datasheet.

Single-Ended SSTL, HSTL, and HSUL I/O Reference Voltage Specifications

| t_{LTD_manual} ⁽⁵⁴⁾ | — | 4 | — | — | μ s |
| $t_{LTR_LTD_manual}$ ⁽⁵⁵⁾ | — | 15 | — | — | μ s |

continued...

⁽⁵⁰⁾ The differential eye opening specification at the receiver input pins assumes that Receiver Equalization is disabled. If you enable Receiver Equalization, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.

⁽⁵¹⁾ Intel Arria 10 devices only support DC coupling when using the Hybrid Memory Cube (HMC) or the Intel QuickPath Interconnect (QPI) specifications.

⁽⁵²⁾ t_{LTR} is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.

⁽⁵³⁾ t_{LTD} is time required for the receiver CDR to start recovering valid data after the `rx_is_lockedto data` signal goes high.

| Symbol/Description | Condition | All Transceiver Speed Grades | | | Unit |
|---|---------------------|------------------------------|-----|------|------|
| | | Min | Typ | Max | |
| Run Length | — | — | — | 200 | UI |
| CDR PPM tolerance | PCIe-only | -300 | — | 300 | PPM |
| | All other protocols | -1000 | — | 1000 | PPM |
| Programmable DC Gain | Setting = 0-4 | 0 | — | 10 | dB |
| Programmable AC Gain at High Gain mode and Data Rate \leq 6 Gbps with 0.95 V V_{CCR} | Setting = 0-28 | 0 | — | 19 | dB |
| Programmable AC Gain at High Gain mode and Data Rate \leq 6 Gbps with 1.03 V V_{CCR} | Setting = 0-28 | 0 | — | 21 | dB |
| Programmable AC Gain at High Gain mode and Data Rate \leq 17.4 Gbps with 1.03 V V_{CCR} | Setting = 0-28 | 0 | — | 17 | dB |
| Programmable AC Gain at High Data Rate mode | Setting = 0-15 | 0 | — | 8 | dB |

(54) t_{LTD_manual} is the time required for the receiver CDR to start recovering valid data after the `rx_is_lockedtodata` signal goes high when the CDR is functioning in the manual mode.

(55) $t_{LTR_LTD_manual}$ is the time the receiver CDR must be kept in lock to reference (LTR) mode after the `rx_is_lockedtoref` signal goes high when the CDR is functioning in the manual mode.

Table 34. Transmitter Specifications

| Symbol/Description | Condition | All Transceiver Speed Grades | | | Unit |
|--|---|---|-----------|-----|------|
| | | Min | Typ | Max | |
| Supported I/O Standards | — | High Speed Differential I/O ⁽⁵⁶⁾ | | | — |
| Differential on-chip termination resistors | 85-Ω setting | — | 85 ± 20% | — | Ω |
| | 100-Ω setting | — | 100 ± 20% | — | Ω |
| V _{OCM} (AC coupled) | V _{CCT} = 0.95 V | — | 450 | — | mV |
| | V _{CCT} = 1.03 V | — | 500 | — | mV |
| | V _{CCT} = 1.12 V | — | 550 | — | mV |
| V _{OCM} (DC coupled) | V _{CCT} = 0.95 V | — | 450 | — | mV |
| | V _{CCT} = 1.03 V | — | 500 | — | mV |
| | V _{CCT} = 1.12 V | — | 550 | — | mV |
| Rise time ⁽⁵⁷⁾ | 20% to 80% | 20 | — | 130 | ps |
| Fall time ⁽⁵⁷⁾ | 80% to 20% | 20 | — | 130 | ps |
| Intra-differential pair skew ⁽⁵⁸⁾ | TX V _{CM} = 0.5 V and slew rate setting of SLEW_R5 ⁽⁵⁹⁾ | — | — | 15 | ps |

⁽⁵⁶⁾ High Speed Differential I/O is the dedicated I/O standard for the transmitter in Intel Arria 10 transceivers.

⁽⁵⁷⁾ The Intel Quartus Prime software automatically selects the appropriate slew rate depending on the design configurations.

⁽⁵⁸⁾ In QPI mode, if V_{CM} < 0.17 V, the input Vid must be greater than 100 mV. If V_{CM} > 0.17 V, the input Vid must be greater than 70 mV.

⁽⁵⁹⁾ SLEW_R1 is the slowest and SLEW_R5 is the fastest. SLEW_R6 and SLEW_R7 are not used.

Table 35. Typical Transmitter V_{OD} Settings

| Symbol | V _{OD} Setting | V _{OD} -to-V _{CCT} Ratio |
|--|-------------------------|--|
| V _{OD} differential value = V _{OD} -to-V _{CCT} ratio x V _{CCT} | 31 | 1.00 |
| | 30 | 0.97 |
| | 29 | 0.93 |
| | 28 | 0.90 |
| | 27 | 0.87 |

Related Information

- [Memory Output Clock Jitter Specifications](#) on page 54
Provides more information about the external memory interface clock output jitter specifications.
- [KDB link: How do I compensate for the jitter of PLL cascading or non-dedicated clock path for Intel Arria 10 PLL reference clock?](#)
For the Intel Quartus Prime software version prior to 17.1, the fPLL output may experience additional jitter. The additional jitter occurs if you source the reference clock from a cascaded PLL output, global clock, or core clock. To compensate for the jitter, the designs require additional constraints. This issue has been fixed in the Intel Quartus Prime software version 17.1.

⁽⁶⁴⁾ A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source with jitter < 120 ps.

⁽⁶⁵⁾ F_{REF} is f_{IN}/N, specification applies when N = 1.

⁽⁶⁶⁾ External memory interface clock output jitter specifications use a different measurement method, which are available in Memory Output Clock Jitter Specification for Intel Arria 10 Devices table.

| f _{OUT_EXT} | Output frequency for external clock output | -1 speed grade | — | — | 800 | MHz |
| | | -2 speed grade | — | — | 720 | MHz |
| | | -3 speed grade | — | — | 650 | MHz |
| t _{OUTDUTY} | Duty cycle for dedicated external clock output (when set to 50%) | Non-SmartVID | 45 | 50 | 55 | % |
| | | SmartVID | 42 | 50 | 58 | % |
| t _{FCOMP} | External feedback clock compensation time | — | — | — | 10 | ns |

continued...

⁽⁶⁷⁾ This specification is limited by the I/O maximum frequency. The maximum achievable I/O frequency is different for each I/O standard and is depends on design and system specific factors. Ensure proper timing closure in your design and perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

| Symbol | Parameter | Condition | Min | Typ | Max | Unit |
|--|--|----------------------------|-----|-----|------|-----------|
| f _{DYCONFIGCLK} | Dynamic configuration clock for mgmt_clk and scanclk | — | — | — | 100 | MHz |
| t _{LOCK} | Time required to lock from end-of-device configuration or deassertion of areset | — | — | — | 1 | ms |
| t _{DLOCK} | Time required to lock dynamically (after switchover or reconfiguring any non-post-scale counters/delays) | — | — | — | 1 | ms |
| t _{PLL_PSERR} | Accuracy of PLL phase shift | — | — | — | ±50 | ps |
| t _{ARESET} | Minimum pulse width on the areset signal | — | 10 | — | — | ns |
| t _{INCCJ} ⁽⁶⁸⁾⁽⁶⁹⁾ | Input clock cycle-to-cycle jitter | F _{REF} ≥ 100 MHz | — | — | 0.15 | UI (p-p) |
| | | F _{REF} < 100 MHz | — | — | 750 | ps (p-p) |
| t _{OUTPJ_DC} | Period jitter for dedicated clock output | F _{OUT} ≥ 100 MHz | — | — | 175 | ps (p-p) |
| | | F _{OUT} < 100 MHz | — | — | 17.5 | mUI (p-p) |
| t _{OUTCCJ_DC} | Cycle-to-cycle jitter for dedicated clock output | F _{OUT} ≥ 100 MHz | — | — | 175 | ps (p-p) |
| | | F _{OUT} < 100 MHz | — | — | 17.5 | mUI (p-p) |
| t _{OUTPJ_IO} ⁽⁷⁰⁾ | Period jitter for clock output on the regular I/O | F _{OUT} ≥ 100 MHz | — | — | 600 | ps (p-p) |
| | | F _{OUT} < 100 MHz | — | — | 60 | mUI (p-p) |
| t _{OUTCCJ_IO} ⁽⁷⁰⁾ | Cycle-to-cycle jitter for clock output on the regular I/O | F _{OUT} ≥ 100 MHz | — | — | 600 | ps (p-p) |
| | | F _{OUT} < 100 MHz | — | — | 60 | mUI (p-p) |
| t _{CASC_OUTPJ_DC} | Period jitter for dedicated clock output in cascaded PLLs | F _{OUT} ≥ 100 MHz | — | — | 175 | ps (p-p) |
| | | F _{OUT} < 100 MHz | — | — | 17.5 | mUI (p-p) |

⁽⁶⁸⁾ A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source with jitter < 120 ps.

⁽⁶⁹⁾ F_{REF} is f_{IN}/N, specification applies when N = 1.

⁽⁷⁰⁾ External memory interface clock output jitter specifications use a different measurement method, which are available in Memory Output Clock Jitter Specification for Intel Arria 10 Devices table.

Related Information

- [Memory Output Clock Jitter Specifications](#) on page 54
Provides more information about the external memory interface clock output jitter specifications.
- [KDB link: How do I compensate for the jitter of PLL cascading or non-dedicated clock path for Intel Arria 10 PLL reference clock?](#)
For the Intel Quartus Prime software version prior to 17.1, the I/O PLL output may experience additional jitter. The additional jitter occurs if you source the reference clock from a cascaded PLL output, global clock, or core clock. To compensate for the jitter, the designs require additional constraints. This issue has been fixed in the Intel Quartus Prime software version 17.1.

DSP Block Specifications

| Floating point vector two mode | 550 | 450 | MHz |

Memory Block Specifications

To achieve the maximum memory block performance, use a memory block clock that comes through global clock routing from an on-chip PLL and set to **50%** output duty cycle. Use the Intel Quartus Prime software to report timing for the memory block clocking schemes.

When you use the error detection cyclical redundancy check (CRC) feature, there is no degradation in f_{MAX} .

| Clock frequency | 0.1 | — | 11 | MHz | |
| Unipolar Input Mode | Input signal range for V_{sigp} | 0 | — | 1.5 | V |
| | Common mode voltage on V_{sigp} | 0 | — | 0.25 | V |
| | Input signal range for $V_{sigp} - V_{sign}$ | 0 | — | 1.25 | V |

Periphery Performance Specifications

This section describes the periphery performance, high-speed I/O, and external memory interface.

Actual achievable frequency depends on design and system specific factors. Ensure proper timing closure in your design and perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

High-Speed I/O Specifications

Table 47. High-Speed I/O Specifications for Intel Arria 10 Devices

When serializer/deserializer (SERDES) factor J = 3 to 10, use the SERDES block.

For LVDS applications, you must use the PLLs in integer PLL mode.

You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine the leftover timing margin.

The Intel Arria 10 devices support the following output standards using true LVDS output buffer types on all I/O banks:

- True RSDS output standard with data rates of up to 360 Mbps
- True mini-LVDS output standard with data rates of up to 400 Mbps

| Symbol | Condition | -E1S ⁽⁷¹⁾ , -E1H, -I1S ⁽⁷¹⁾ , -I1H | | | -E2L, -E2S ⁽⁷¹⁾ , -I2L, -I2S ⁽⁷¹⁾ | | | -E3L, -E3S ⁽⁷¹⁾ , -E3V, -I3L, -I3S ⁽⁷¹⁾ , -I3V | | | Unit |

- (71) -E1S and -E2S speed grades are applicable to both V_{CC} = 0.9 V and 0.95 V. -E3S speed grade is only applicable to V_{CC} = 0.9 V.
- (74) Requires package skew compensation with PCB trace length.
- (75) The F_{max} specification is based on the fast clock used for serial data. The interface F_{max} is also dependent on the parallel clock domain which is design dependent and requires timing analysis.
- (76) The V_{CC} and V_{CCP} must be on a combined power layer and a maximum load of 5 pF for chip-to-chip interface.
- (77) The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and serializer do not have a minimum toggle rate.
- (78) The maximum ideal data rate is the SERDES factor (J) x the PLL maximum output frequency (f_{OUT}) provided you can close the design timing and the signal integrity meets the interface requirements.

Related Information

[External Memory Interface Spec Estimator](#)

Provides the specific details of the memory standards supported.

(83) Intel Arria 10 devices support this external memory interface using hard PHY with soft memory controller.

DLL Range Specifications

Table 53. DLL Frequency Range Specifications for Intel Arria 10 Devices

Intel Arria 10 devices support memory interface frequencies lower than 600 MHz, although the reference clock that feeds the DLL must be at least 600 MHz. To support interfaces below 600 MHz, multiply the reference clock feeding the DLL to ensure the frequency is within the supported range.

| Parameter | Performance (for All Speed Grades) | Unit |
|-------------------------------|------------------------------------|------|
| DLL operating frequency range | 600 – 1333 | MHz |

DQS Logic Block Specifications

Table 54. DQS Phase Shift Error Specifications for DLL-Delayed Clock (t_{DQS_PSERR}) for Intel Arria 10 Devices

This error specification is the absolute maximum and minimum error.

| Symbol | Performance (for All Speed Grades) | Unit |
|------------------|------------------------------------|------|
| t_{DQS_PSERR} | 5 | ps |

Memory Output Clock Jitter Specifications

Table 55. Memory Output Clock Jitter Specifications for Intel Arria 10 Devices

The clock jitter specification applies to the memory output clock pins clocked by an I/O PLL, or generated using differential signal-splitter and double data I/O circuits clocked by a PLL output routed on a PHY clock network as specified. Intel recommends using PHY clock networks for better jitter performance.

The memory output clock jitter is applicable when an input jitter of 10 ps peak-to-peak is applied with bit error rate (BER) 10^{-12} , equivalent to 14 sigma.

| Protocol | Parameter | Symbol | Non-SmartVID | | | SmartVID (~3V Speed Grade) | | | Unit |
|----------|------------------------------|-----------------|------------------|-----|-----|----------------------------|------|-----|------|
| | | | Data Rate (Mbps) | Min | Max | Data Rate (Mbps) | Min | Max | |
| DDR3 | Clock period jitter | $t_{JIT(per)}$ | 2,133 | -40 | 40 | 1,600 | -70 | 70 | ps |
| | Cycle-to-cycle period jitter | $t_{JIT(cc)}$ | 2,133 | -40 | 40 | 1,600 | -70 | 70 | ps |
| | Duty cycle jitter | $t_{JIT(duty)}$ | 2,133 | -40 | 40 | 1,600 | -100 | 100 | ps |
| DDR4 | Clock period jitter | $t_{JIT(per)}$ | 2,400 | -40 | 40 | 1,600 | -63 | 63 | ps |
| | Cycle-to-cycle period jitter | $t_{JIT(cc)}$ | 2,400 | -40 | 40 | 1,600 | -63 | 63 | ps |
| | Duty cycle jitter | $t_{JIT(duty)}$ | 2,400 | -40 | 40 | 1,600 | -100 | 100 | ps |

OCT Calibration Block Specifications

Table 56. OCT Calibration Block Specifications for Intel Arria 10 Devices

| Symbol | Description | Min | Typ | Max | Unit |
|-----------------------|---|--------|-----|-----|--------|
| OCTUSRCLK | Clock required by OCT calibration blocks | — | — | 20 | MHz |
| T _{OCTCAL} | Number of OCTUSRCLK clock cycles required for R _S OCT /R _T OCT calibration | > 2000 | — | — | Cycles |
| T _{OCTSHIFT} | Number of OCTUSRCLK clock cycles required for OCT code to shift out | — | 32 | — | Cycles |
| T _{RS_RT} | Time required between the <code>dyn_term_ctrl</code> and <code>oe</code> signal transitions in a bidirectional I/O buffer to dynamically switch between R _S OCT and R _T OCT | — | 2.5 | — | ns |

Figure 5. Timing Diagram for on `oe` and `dyn_term_ctrl` Signals

HPS Specifications

This section provides HPS specifications and timing for Intel Arria 10 devices.

If you are using the early I/O release configuration flow, you cannot initially use SmartVID to power your device. Instead, you can use a fixed power supply until after the FPGA is configured. When the FPGA is configured, you can then enable SmartVID.

HPS Reset Input Requirements

Table 57. HPS Reset Input Requirements for Intel Arria 10 Devices

| Description | Min | Max | Unit |
|--|-----|------|------------------------------|
| HPS cold reset pulse width | 600 | — | ns |
| HPS warm reset pulse width | 600 | — | ns |
| Cold reset deassertion to BSEL sampling, using <code>osc1_clk</code> ⁽⁸⁴⁾ | — | 1000 | <code>osc1_clk</code> cycles |
| Cold reset deassertion to BSEL sampling, using secure clock, without RAM clearing | — | 100 | μs |
| Cold reset deassertion to BSEL sampling, using secure clock, with RAM clearing | — | 50 | ms |

⁽⁸⁴⁾ `osc1_clk` is supplied from the HPS_CLK1 pin.

HPS Clock Performance

Table 58. Maximum HPS Clock Frequencies Across Device Speed Grades for Intel Arria 10 Devices

| HPS Clock | Temperature Grade | V _{CCL_HPS} = 0.9 V (typical) | | | V _{CCL_HPS} = 0.95 V (typical) ⁽⁸⁵⁾ | | | Unit |
|------------------------------|-------------------|--|----------------|----------------|---|----------------|----------------|------|
| | | -1 Speed Grade | -2 Speed Grade | -3 Speed Grade | -1 Speed Grade | -2 Speed Grade | -3 Speed Grade | |
| mpu_base_clk | All | 1,200 | 1,000 | 800 | 1,500 | 1,200 | 1,000 | MHz |
| noc_base_clk | All | 400 | 400 | 300 | 500 | 400 | 300 | MHz |
| hmc_free_clk ⁽⁸⁶⁾ | All | 600 | 533 | 467 | 600 | 533 | 467 | MHz |

HPS PLL Specifications

HPS PLL Input Requirements

The HPS main PLL receives the clock signal from the HPS_CLK1 pin. For details on this pin, refer to the *Intel Arria 10 GX, GT, and SX Device Family Pin Connection Guidelines*.

⁽⁸⁵⁾ You must use 0.95 V V_{CCL_HPS} for CSEL values of 0x7 – 0xE.

⁽⁸⁶⁾ The hmc_free_clk is 1/2 of the SDRAM interface clock. For the external memory interface clock specifications, refer to the External Memory Interface Spec Estimator.

Table 59. HPS PLL Input Requirements for Intel Arria 10 Devices

| Description | Min | Typ | Max | Unit |
|------------------------------|-----|-----|-----|------|
| Clock input range | 10 | — | 50 | MHz |
| Clock input jitter tolerance | — | — | 2 | % |
| Clock input duty cycle | 45 | 50 | 55 | % |

| Description | Min | Max | Max | Unit |
|------------------------|------|-----|------|------|
| Clock jitter tolerance | -2.5 | — | 2.5 | % |
| Clock duty cycle | 45 | 50 | 55 | % |
| Clock rise time | 350 | — | 1075 | ps |
| Clock fall time | 200 | — | 450 | ps |
| HPS PLL lock time | — | — | 3.6 | ms |

Quad SPI Flash Timing Characteristics

Table 62. Quad Serial Peripheral Interface (SPI) Flash Timing Requirements for Intel Arria 10 Devices

Note that the Intel Arria 10 HPS boot loader calibrates the input timing automatically.

| Symbol | Description | Min | Typ | Max | Unit |
|----------------------|---|--|-----|------|----------|
| $T_{qspi_ref_clk}$ | QSPI_REF_CLK clock period | 2.5 | — | — | ns |
| T_{clk} | QSPI_CLK clock period | 9.25 | — | — | ns |
| $T_{dutycycle}$ | QSPI_CLK duty cycle | 45 | 50 | 55 | % |
| $T_{dssfrst}^{(87)}$ | QSPI_SS asserted to first QSPI_CLK edge | 3.6 | — | 5.25 | ns |
| $T_{dsslst}^{(87)}$ | Last QSPI_CLK edge to QSPI_SS deasserted | -1 | — | 1 | ns |
| T_{do} | QSPI_DATA output delay | 0 | — | 2.6 | ns |
| T_{su} | Input setup with respect to QSPI_CLK capture edge | $6.5 - (R_{delay} \times T_{qspi_ref_clk})^{(88)}$ | — | — | ns |
| T_h | Input hold with respect to QSPI_CLK capture edge | $(R_{delay} + 1) \times T_{qspi_ref_clk}^{(88)}$ | — | — | ns |
| $T_{dssb2b}^{(87)}$ | Minimum delay of slave select deassertion between two back-to-back transfer | 1 | — | — | QSPI_CLK |

Figure 6. Quad SPI Flash Serial Output Timing Diagram

(87) This delay is programmable in whole QSPI_REF_CLK increments using the `delay` register in the Quad SPI module.

(88) R_{delay} is programmable in whole QSPI_REF_CLK increments using the `delay` field in the `rddatacap` register in the Quad SPI module.

Figure 7. Quad SPI Flash Serial Input Timing Diagram

SPI Timing Characteristics

Table 63. SPI Master Timing Requirements for Intel Arria 10 Devices

You can adjust the input delay timing by programming the `rx_sample_dly` register.

| Symbol | Description | Min | Typ | Max | Unit |
|----------------------|---|-------------------------------|-----|-----|------|
| T_{clk} | SPI_CLK clock period | 16.67 | — | — | ns |
| $T_{dutycycle}$ | SPI_CLK duty cycle | 45 | 50 | 55 | % |
| $T_{dssfrst}^{(89)}$ | SPI_SS asserted to first SPI_CLK edge | $1.5 \times T_{SPI_CLK} - 2$ | — | — | ns |
| $T_{dsslst}^{(89)}$ | Last SPI_CLK edge to SPI_SS deasserted | $T_{SPI_CLK} - 2$ | — | — | ns |
| T_{dio} | Master-out slave-in (MOSI) output delay | -1 | — | 1 | ns |

continued...

⁽⁸⁹⁾ SPI_SS behavior differs depending on Motorola SPI, TI SSP or Microwire operational mode.

| Symbol | Description | Min | Typ | Max | Unit |
|---------------------------------|---|---|-----|-----|---------|
| T _{su} ⁽⁹⁰⁾ | Input setup in respect to SPI_CLK capture edge | 16 - (rx_sample_dly × T _{spi_ref_clk}) ⁽⁹¹⁾ ₍₉₂₎ | — | — | ns |
| T _h ⁽⁹⁰⁾ | Input hold in respect to SPI_CLK capture edge | 0 | — | — | ns |
| T _{dssb2b} | Minimum delay of slave select deassertion between two back-to-back transfers (frames) | 1 | — | — | SPI_CLK |

⁽⁹⁰⁾ The capture edge differs depending on the operational mode. For Motorola SPI, the capture edge can be the rising or falling edge depending on the `scpol` register bit; for TI SSP, the capture edge is the falling edge; for Microwire, the capture edge is the rising edge.

⁽⁹¹⁾ A `rx_sample_dly` value of 0 is an invalid setting.

⁽⁹²⁾ `SPI_REF_CLK` is the internal reference clock of the SPI Slave, which is `l4_main_clk`.

Figure 9. SPI Master Input Timing Diagram

*Serial clock phase configuration bit, in the SPI controller's CTRLR0 register

Table 64. SPI Slave Timing Requirements for Intel Arria 10 Devices

| Symbol | Description | Min | Typ | Max | Unit |
|------------------------|---|---|-----|--|------|
| T _{clk} | SPI_CLK clock period | 20 | — | — | ns |
| T _{dutycycle} | SPI_CLK duty cycle | 45 | 50 | 55 | % |
| T _s | SPI slave input setup time | 5 | — | — | ns |
| T _h | SPI slave input hold time | 8 | — | — | ns |
| T _{suss} | SPI_SS asserted to first SCLK_IN edge | 5 | — | — | ns |
| T _{hss} | Last SCLK_IN edge to SPI_SS deasserted | 5 | — | — | ns |
| T _d | Master-in slave-out (MISO) output delay | $2 \times T_{spi_ref_clk} + 5.3^{(93)}$ | — | $3 \times T_{spi_ref_clk} + 11.8^{(93)}$ | ns |

⁽⁹³⁾ SPI_REF_CLK is the internal reference clock of the SPI Slave, which is 14_main_clk.

Figure 10. SPI Slave Output Timing Diagram

*Serial clock phase configuration bit, in the SPI controller's CTRLR0 register

Figure 11. SPI Slave Input Timing Diagram

*Serial clock phase configuration bit, in the SPI controller's CTRLR0 register

SD/MMC Timing Characteristics

Table 65. Secure Digital (SD)/MultiMediaCard (MMC) Timing Requirements for Intel Arria 10 Devices

These timings apply to SD, MMC, and embedded MMC cards operating at 1.8 V and 3.0 V.

| Symbol | Description | Min | Typ | Max | Unit |
|-------------------------|---|--|------|---|------|
| T _{sdmmc_cclk} | SDMMC_CCLK clock period (Identification mode) | — | 2500 | — | ns |
| | SDMMC_CCLK clock period (Standard SD mode) | — | 40 | — | ns |
| | SDMMC_CCLK clock period (High speed SD mode) | — | 20 | — | ns |
| T _{dutycycle} | SDMMC_CCLK duty cycle | 45 | 50 | 55 | % |
| T _{su} | SDMMC_CMD/SDMMC_D[7:0] input setup ⁽⁹⁴⁾ | $7 - (14_mp_clk \times smp1sel/2)$ | — | — | ns |
| T _h | SDMMC_CMD/SDMMC_D[7:0] input hold ⁽⁹⁴⁾ | $-2.5 + (14_mp_clk \times smp1sel/2)$ | — | — | ns |
| T _d | SDMMC_CMD/SDMMC_D[7:0] output delay ⁽⁹⁵⁾ | $-1 + (14_mp_clk \times drvsel/2)$ ⁽⁹⁶⁾ | — | $4 + (14_mp_clk \times drvsel/2)$ ⁽⁹⁶⁾ | ns |

⁽⁹⁴⁾ When `smp1sel` is set to 2 (in the system manager) and the reference clock (`14_mp_clk`) is 200 MHz for example, the setup time is 2 ns and the hold time is 2.5 ns. The Boot ROM uses a `smp1sel` setting of 0 and U-Boot can adjust this setting later in the boot process.

⁽⁹⁵⁾ When `drvsel` is set to 3 (in the system manager) and the reference clock (`14_mp_clk`) is 200 MHz for example, the output delay time is 6.5 to 11.5 ns. The Boot ROM uses a `drvsel` setting of 3 and the Intel Quartus Prime software can adjust this setting later in the boot process. `drvsel` set to 0 is not a valid setting.

⁽⁹⁶⁾ `14_mp_clk` is the SD/MMC controller reference clock.

Related Information

I/O Pin Timing, Intel Arria 10 SoC Device Design Guidelines

I²C Timing Characteristics

Table 73. I²C Timing Requirements for Intel Arria 10 Devices

| Symbol | Description | Standard Mode | | Fast Mode | | Unit |
|--------------------|---------------------------------|----------------------|-----|----------------------|-----|---------|
| | | Min | Max | Min | Max | |
| T_{clk} | Serial clock (SCL) clock period | 10 | — | 2.5 | — | μ s |
| $t_{HIGH}^{(100)}$ | SCL high period | 4 ⁽¹⁰¹⁾ | — | 0.6 ⁽¹⁰²⁾ | — | μ s |
| $t_{LOW}^{(103)}$ | SCL low period | 4.7 ⁽¹⁰⁴⁾ | — | 1.3 ⁽¹⁰⁵⁾ | — | μ s |

continued...

⁽¹⁰⁰⁾ You can adjust $T_{clkhigh}$ using the `ic_ss_scl_hcnt` or `ic_fs_scl_hcnt` register.

⁽¹⁰¹⁾ The recommended minimum setting for `ic_ss_scl_hcnt` is 440.

⁽¹⁰²⁾ The recommended minimum setting for `ic_fs_scl_hcnt` is 71.

⁽¹⁰³⁾ You can adjust T_{clklow} using the `ic_ss_scl_lcnt` or `ic_fs_scl_lcnt` register.

⁽¹⁰⁴⁾ The recommended minimum setting for `ic_ss_scl_lcnt` is 500.

| Symbol | Description | Standard Mode | | Fast Mode | | Unit |
|---------------------------------------|---|---------------|-----------------------|------------------------------------|----------------------|---------|
| | | Min | Max | Min | Max | |
| $t_{SU;DAT}$ | Setup time for serial data line (SDA) data to SCL | 0.25 | — | 0.1 | — | μs |
| $t_{HD;DAT}^{(106)}$ | Hold time for SCL to SDA data | 0 | 3.15 | 0 | 0.6 | μs |
| $t_{VD;DAT}$ and $t_{VD;ACK}^{(107)}$ | SCL to SDA output data delay | — | 3.45 ⁽¹⁰⁸⁾ | — | 0.9 ⁽¹⁰⁹⁾ | μs |
| $t_{SU;STA}$ | Setup time for a repeated start condition | 4.7 | — | 0.6 | — | μs |
| $t_{HD;STA}$ | Hold time for a repeated start condition | 4 | — | 0.6 | — | μs |
| $t_{SU;STO}$ | Setup time for a stop condition | 4 | — | 0.6 | — | μs |
| t_{BUF} | SDA high pulse duration between STOP and START | 4.7 | — | 1.3 | — | μs |
| $t_r^{(110)}$ | SCL rise time | — | 1000 | 20 | 300 | ns |
| $t_f^{(110)}$ | SCL fall time | — | 300 | $20 \times (V_{dd} / 5.5)^{(111)}$ | 300 | ns |
| $t_r^{(110)}$ | SDA rise time | — | 1000 | 20 | 300 | ns |
| $t_f^{(110)}$ | SDA fall time | — | 300 | $20 \times (V_{dd} / 5.5)^{(111)}$ | 300 | ns |

(105) The recommended minimum setting for `ic_fs_scl_lcnt` is 141.

(106) $T_{HD;DAT}$ is affected by the rise and fall time.

(107) $t_{VD;DAT}$ and $t_{VD;ACK}$ is affected by the rise and fall time, in addition to the SDA hold time that is set by adjusting the `ic_sda_hold` register.

(108) Use maximum `SDA_HOLD` = 240 to be within the specification.

(109) Use maximum `SDA_HOLD` = 60 to be within the specification.

(110) Rise and fall time parameters vary depending on the external factors such as: characteristics of IO driver, pull-out resistor value, and total capacitance on the transmission line.

(111) V_{dd} is the I²C bus voltage.

Trace Timing Characteristics

Table 75. Trace Timing Requirements for Intel Arria 10 Devices

To increase the trace bandwidth, Intel recommends routing the trace interface to the FPGA in the HPS Platform Designer (Standard) component. The FPGA trace interface offers a 32-bit single data rate path that can be converted to double data rate to minimize FPGA I/O usage.

Depending on the trace module that you connect to the HPS trace interface, you may need to include board termination to achieve the maximum sampling speed possible. Refer to your trace module datasheet for termination recommendations.

| Symbol | Description | Min | Typ | Max | Unit |
|-------------------|--------------------------------|------|-----|-----|------|
| T_{clk} | CLK clock period | 10 | — | — | ns |
| $T_{duty\ cycle}$ | CLK maximum duty cycle | 45 | 50 | 55 | % |
| T_d | CLK to D0–D3 output data delay | –0.5 | — | 1 | ns |

Figure 25. Trace Timing Diagram

GPIO Interface

The general-purpose I/O (GPIO) interface has debounce circuitry included to remove signal glitches. The debounce clock frequency ranges from 125 Hz to 32 kHz. The minimum pulse width is one debounce clock cycle and the minimum detectable GPIO pulse width is 62.5 μ s (at 32 kHz). Any pulses shorter than two debounce clock cycles are filtered by the GPIO peripheral.

If the external signal is less than one clock cycle, the external signal is filtered. If the external signal is between one and two clock cycles, the external signal may or may not be filtered depending on the phase of the signal. If the external signal is more than two clock cycles, the external signal will not be filtered.

To ensure that the external signal is correctly debounced, set the debounce clock low enough so that by the time two debounce clock periods have passed, the signal has settled.

Configuration Specifications

This section provides configuration specifications and timing for Intel Arria 10 devices.

POR Specifications

Power-on reset (POR) delay is defined as the delay between the time when all the power supplies monitored by the POR circuitry reach the minimum recommended operating voltage to the time when the `nSTATUS` is released high and your device is ready to begin configuration.

Table 76. Fast and Standard POR Delay Specification for Intel Arria 10 Devices

| POR Delay | Minimum | Maximum | Unit |
|-----------|---------|---------------------|------|
| Fast | 4 | 12 ⁽¹¹³⁾ | ms |
| Standard | 100 | 300 | ms |

Related Information

[MSEL Pin Settings](#)

JTAG Configuration Timing

Table 77. JTAG Timing Parameters and Values for Intel Arria 10 Devices

| Symbol | Description | Min | Max | Unit |
|-------------------------|--|--------------------------|-----|------|
| t _{JCP} | TCK clock period | 30, 167 ⁽¹¹⁴⁾ | — | ns |
| t _{JCH} | TCK clock high time | 14 | — | ns |
| t _{JCL} | TCK clock low time | 14 | — | ns |
| t _{JPSU (TDI)} | TDI JTAG port setup time | 2 | — | ns |
| t _{JPSU (TMS)} | TMS JTAG port setup time | 3 | — | ns |
| t _{JPH} | JTAG port hold time | 5 | — | ns |
| t _{JPCO} | JTAG port clock to output | — | 11 | ns |
| t _{JPZX} | JTAG port high impedance to valid output | — | 14 | ns |
| t _{JPXZ} | JTAG port valid output to high impedance | — | 14 | ns |

Related Information

[Glossary](#) on page 95

Provides the JTAG configuration timing waveforms in the JTAG Timing Specifications term.

(113) The maximum pulse width of the fast POR delay is 12 ms, providing enough time for the PCIe hard IP to initialize after the POR trip.

(114) The minimum TCK clock period is 167 ns if V_{CCBAT} is within the range 1.2 V – 1.5 V when you perform the volatile key programming.

FPP Configuration Timing

DCLK-to-DATA[] Ratio (r) for FPP Configuration

Fast passive parallel (FPP) configuration requires a different DCLK-to-DATA[] ratio when you turn on encryption or the compression feature.

Depending on the DCLK-to-DATA[] ratio, the host must send a DCLK frequency that is r times the DATA[] rate in byte per second (Bps) or word per second (Wps). For example, in FPP $\times 16$ where the r is 2, the DCLK frequency must be 2 times the DATA[] rate in Wps.

Table 78. DCLK-to-DATA[] Ratio for Intel Arria 10 Devices

You cannot turn on encryption and compression at the same time for Intel Arria 10 devices.

| Configuration Scheme | Encryption | Compression | DCLK-to-DATA[] Ratio (r) |
|----------------------|------------|-------------|--------------------------|
| FPP (8-bit wide) | Off | Off | 1 |
| | On | Off | 1 |
| | Off | On | 2 |
| FPP (16-bit wide) | Off | Off | 1 |
| | On | Off | 2 |
| | Off | On | 4 |
| FPP (32-bit wide) | Off | Off | 1 |
| | On | Off | 4 |
| | Off | On | 8 |

FPP Configuration Timing when DCLK-to-DATA[] = 1

Note: When you enable decompression or the design security feature, the DCLK-to-DATA[] ratio varies for FPP $\times 8$, FPP $\times 16$, and FPP $\times 32$. For the respective DCLK-to-DATA[] ratio, refer to the DCLK-to-DATA[] Ratio for Intel Arria 10 Devices table.

Table 79. FPP Timing Parameters When the DCLK-to-DATA[] Ratio is 1 for Intel Arria 10 Devices

Use these timing parameters when the decompression and design security features are disabled.

| Symbol | Parameter | Minimum | Maximum | Unit |
|-------------------------------------|---|-------------------------|------------------------|------|
| t _{CF2CD} | nCONFIG low to CONF_DONE low | — | 1,440 | ns |
| t _{CF2ST0} | nCONFIG low to nSTATUS low | — | 960 | ns |
| t _{CFG} | nCONFIG low pulse width | 2 | — | μs |
| t _{STATUS} | nSTATUS low pulse width | 268 | 3,000 ⁽¹¹⁵⁾ | μs |
| t _{CF2ST1} | nCONFIG high to nSTATUS high | — | 3,000 ⁽¹¹⁶⁾ | μs |
| t _{CF2CK} ⁽¹¹⁷⁾ | nCONFIG high to first rising edge on DCLK | 3,010 | — | μs |
| t _{ST2CK} ⁽¹¹⁷⁾ | nSTATUS high to first rising edge of DCLK | 10 | — | μs |
| t _{DSU} | DATA[] setup time before rising edge on DCLK | 5.5 | — | ns |
| t _{DH} | DATA[] hold time after rising edge on DCLK | 0 | — | ns |
| t _{CH} | DCLK high time | $0.45 \times 1/f_{MAX}$ | — | s |
| t _{CL} | DCLK low time | $0.45 \times 1/f_{MAX}$ | — | s |
| t _{CLK} | DCLK period | $1/f_{MAX}$ | — | s |
| f _{MAX} | DCLK frequency (FPP × 8/× 16/× 32) | — | 100 | MHz |

continued...

⁽¹¹⁵⁾ This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.

⁽¹¹⁶⁾ This value is applicable if you do not delay configuration by externally holding the nSTATUS low.

⁽¹¹⁷⁾ If nSTATUS is monitored, follow the t_{ST2CK} specification. If nSTATUS is not monitored, follow the t_{CF2CK} specification.

| Symbol | Parameter | Minimum | Maximum | Unit |
|---------------------|---|--|---------|------|
| t _{CD2UM} | CONF_DONE high to user mode ⁽¹¹⁸⁾ | 175 | 830 | μs |
| t _{CD2CU} | CONF_DONE high to CLKUSR enabled | 4 × maximum DCLK period | — | — |
| t _{CD2UMC} | CONF_DONE high to user mode with CLKUSR option on | t _{CD2CU} + (600 × CLKUSR period) | — | — |

FPP Configuration Timing when DCLK-to-DATA[] >1

Table 80. FPP Timing Parameters When the DCLK-to-DATA[] Ratio is >1 for Intel Arria 10 Devices

Use these timing parameters when you use the decompression and design security features.

| Symbol | Parameter | Minimum | Maximum | Unit |
|-------------------------------------|---|---------|------------------------|------|
| t _{CF2CD} | nCONFIG low to CONF_DONE low | — | 1,440 | ns |
| t _{CF2ST0} | nCONFIG low to nSTATUS low | — | 960 | ns |
| t _{CFG} | nCONFIG low pulse width | 2 | — | μs |
| t _{STATUS} | nSTATUS low pulse width | 268 | 3,000 ⁽¹¹⁹⁾ | μs |
| t _{CF2ST1} | nCONFIG high to nSTATUS high | — | 3,000 ⁽¹¹⁹⁾ | μs |
| t _{CF2CK} ⁽¹²⁰⁾ | nCONFIG high to first rising edge on DCLK | 3,010 | — | μs |
| t _{ST2CK} ⁽¹²⁰⁾ | nSTATUS high to first rising edge of DCLK | 10 | — | μs |
| t _{DSU} | DATA[] setup time before rising edge on DCLK | 5.5 | — | ns |

continued...

⁽¹¹⁸⁾ The minimum and maximum numbers apply only if you chose the internal oscillator as the clock source for initializing the device.

⁽¹¹⁹⁾ You can obtain this value if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.

⁽¹²⁰⁾ If nSTATUS is monitored, follow the t_{ST2CK} specification. If nSTATUS is not monitored, follow the t_{CF2CK} specification.

| Symbol | Parameter | Minimum | Maximum | Unit |
|---------------------|---|--|---------|------|
| t _{DH} | DATA[] hold time after rising edge on DCLK | $N-1/f_{DCLK}$ ⁽¹²¹⁾ | — | s |
| t _{CH} | DCLK high time | $0.45 \times 1/f_{MAX}$ | — | s |
| t _{CL} | DCLK low time | $0.45 \times 1/f_{MAX}$ | — | s |
| t _{CLK} | DCLK period | $1/f_{MAX}$ | — | s |
| f _{MAX} | DCLK frequency (FPP ×8/×16/×32) | — | 100 | MHz |
| t _{CD2UM} | CONF_DONE high to user mode ⁽¹²²⁾ | 175 | 830 | μs |
| t _{CD2CU} | CONF_DONE high to CLKUSR enabled | 4 × maximum DCLK period | — | — |
| t _{CD2UMC} | CONF_DONE high to user mode with CLKUSR option on | t _{CD2CU} + (600 × CLKUSR period) | — | — |

DCLK Frequency Specification in the AS Configuration Scheme

Table 82. DCLK Frequency Specification in the AS Configuration Scheme

This table lists the internal clock frequency specification for the AS configuration scheme.

The DCLK frequency specification applies when you use the internal oscillator as the configuration clock source.

The AS multi-device configuration scheme does not support DCLK frequency of 100 MHz.

You can only set 12.5, 25, 50, and 100 MHz in the Intel Quartus Prime software.

| Parameter | Minimum | Typical | Maximum | Intel Quartus Prime Software Settings | Unit |
|---|---------|---------|---------|---------------------------------------|------|
| DCLK frequency in AS configuration scheme | 5.3 | 7.5 | 9.7 | 12.5 | MHz |
| | 10.5 | 15.0 | 19.3 | 25.0 | MHz |
| | 21.0 | 30.0 | 38.5 | 50.0 | MHz |
| | 42.0 | 60.0 | 77.0 | 100.0 | MHz |

PS Configuration Timing

Table 83. PS Timing Parameters for Intel Arria 10 Devices

| Symbol | Parameter | Minimum | Maximum | Unit |
|-------------------------------------|---|-------------------------|------------------------|------|
| t _{CF2CD} | nCONFIG low to CONF_DONE low | — | 1,440 | ns |
| t _{CF2ST0} | nCONFIG low to nSTATUS low | — | 960 | ns |
| t _{CFG} | nCONFIG low pulse width | 2 | — | μs |
| t _{STATUS} | nSTATUS low pulse width | 268 | 3,000 ⁽¹²³⁾ | μs |
| t _{CF2ST1} | nCONFIG high to nSTATUS high | — | 3,000 ⁽¹²⁴⁾ | μs |
| t _{CF2CK} ⁽¹²⁵⁾ | nCONFIG high to first rising edge on DCLK | 3,010 | — | μs |
| t _{ST2CK} ⁽¹²⁵⁾ | nSTATUS high to first rising edge of DCLK | 10 | — | μs |
| t _{DSU} | DATA[] setup time before rising edge on DCLK | 5.5 | — | ns |
| t _{DH} | DATA[] hold time after rising edge on DCLK | 0 | — | ns |
| t _{CH} | DCLK high time | $0.45 \times 1/f_{MAX}$ | — | s |
| t _{CL} | DCLK low time | $0.45 \times 1/f_{MAX}$ | — | s |
| t _{CLK} | DCLK period | $1/f_{MAX}$ | — | s |
| f _{MAX} | DCLK frequency | — | 125 | MHz |

continued...

⁽¹²³⁾ This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.

⁽¹²⁴⁾ This value is applicable if you do not delay configuration by externally holding the nSTATUS low.

⁽¹²⁵⁾ If nSTATUS is monitored, follow the t_{ST2CK} specification. If nSTATUS is not monitored, follow the t_{CF2CK} specification.

| Symbol | Parameter | Minimum | Maximum | Unit |
|---------------------|---|--|---------|------|
| t _{CD2UM} | CONF_DONE high to user mode ⁽¹²⁶⁾ | 175 | 830 | μs |
| t _{CD2CU} | CONF_DONE high to CLKUSR enabled | 4 × maximum DCLK period | — | — |
| t _{CD2UMC} | CONF_DONE high to user mode with CLKUSR option on | t _{CD2CU} + (600 × CLKUSR period) | — | — |

Related Information

PS Configuration Timing

Provides the PS configuration timing waveform.

Initialization

Table 84. Initialization Clock Source Option and the Maximum Frequency for Intel Arria 10 Devices

| Initialization Clock Source | Configuration Scheme | Maximum Frequency (MHz) | Number of Clock Cycles for Initialization |
|------------------------------|----------------------|-------------------------|---|
| Internal Oscillator | AS, PS, and FPP | 12.5 | 600 |
| CLKUSR ⁽¹²⁷⁾⁽¹²⁸⁾ | AS, PS, and FPP | 100 | |

Configuration Files

There are two types of configuration bit stream formats for different configuration schemes:

- PS and FPP—Raw Binary File (.rbf)
- AS—Raw Programming Data File (.rpd)

⁽¹²⁶⁾ The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.

⁽¹²⁷⁾ To enable CLKUSR as the initialization clock source, in the Intel Quartus Prime software, select **Device and Pin Options > General > Device initialization clock source > CLKUSR pin**.

⁽¹²⁸⁾ If you use the CLKUSR pin for AS and transceiver calibration simultaneously, the only allowed frequency is 100 MHz.

The .rpd file size follows the Intel configuration devices capacity. However, the actual configuration bit stream size for .rpd file is the same as .rbf file.

Table 85. Configuration Bit Stream Sizes for Intel Arria 10 Devices

Use this table to estimate the file size before design compilation. Different configuration file formats, such as a hexadecimal file (.hex) or tabular text file (.ttf) format, have different file sizes.

For the different types of configuration file and file sizes, refer to the Intel Quartus Prime software. However, for a specific version of the Intel Quartus Prime software, any design targeted for the same device has the same uncompressed configuration file size.

I/O configuration shift register (IOCSR) is a long shift register that facilitates the device I/O peripheral settings. The IOCSR bit stream is part of the uncompressed configuration bit stream, and it is specifically for the Configuration via Protocol (CvP) feature.

Uncompressed configuration bit stream sizes are subject to change for improvements and optimizations in the configuration algorithm.

| Variant | Product Line | Uncompressed Configuration Bit Stream Size (bits) | IOCSR Bit Stream Size (bits) | Recommended EPCQ-L Serial Configuration Device |

| User watchdog internal oscillator frequency | 5.3 | 7.9 | 12.5 | MHz |

I/O Timing

I/O timing data is typically used prior to designing the FPGA to get an estimate of the timing budget as part of the timing analysis. You may generate the I/O timing report manually using the Timing Analyzer or using the automated script.

-
- ⁽¹³¹⁾ This clock is user-supplied to the remote system upgrade circuitry. If you are using the Remote Update Intel FPGA IP core, the clock user-supplied to the Remote Update Intel FPGA IP core must meet this specification.
- ⁽¹³²⁾ This is equivalent to strobing the reconfiguration input of the Remote Update Intel FPGA IP core high for the minimum timing specification.
- ⁽¹³³⁾ This is equivalent to strobing the reset_timer input of the Remote Update Intel FPGA IP core high for the minimum timing specification.

The Intel Quartus Prime Timing Analyzer provides a more accurate and precise I/O timing data based on the specifics of the design after you complete place-and-route.

Related Information

[AN 775: I/O Timing Information Generation Guidelines](#)

Provides the techniques to generate I/O timing information using the Intel Quartus Prime software.

Programmable IOE Delay

Table 89. IOE Programmable Delay for Intel Arria 10 Devices

For the exact values for each setting, use the latest version of the Intel Quartus Prime software. The values in the table show the delay of programmable IOE delay chain with maximum offset settings after excluding the intrinsic delay (delay at minimum offset settings).

Programmable IOE delay settings are only applicable for I/O buffers and do not apply for any other delay elements in the PHYLite for Parallel Interfaces Intel Arria 10 FPGA IP core.

| Parameter ⁽¹³⁴⁾ | Maximum Offset | Minimum Offset ⁽¹³⁵⁾ | Fast Model | | Slow Model | | | Unit |

| R_L | Receiver differential input discrete resistor (external to the Intel Arria 10 device). |
| Sampling window (SW) | <p>Timing Diagram—the period of time during which the data must be valid in order to capture it correctly. The setup and hold times determine the ideal strobe position in the sampling window, as shown:</p> |
| Single-ended voltage referenced I/O standard | <p>The JEDEC standard for the SSTL and HSTL I/O defines both the AC and DC input signal values. The AC values indicate the voltage levels at which the receiver must meet its timing specifications. The DC values indicate the voltage levels at which the final logic state of the receiver is unambiguously defined. After the receiver input has crossed the AC value, the receiver changes to the new logic state.</p> <p>The new logic state is then maintained as long as the input stays beyond the DC threshold. This approach is intended to provide predictable receiver timing in the presence of input waveform ringing.</p> <p>Single-Ended Voltage Referenced I/O Standard</p> |

| Term | Definition |
|--------------------------------|---|
| | |
| t_c | High-speed receiver/transmitter input and output clock period. |
| TCCS (channel-to-channel-skew) | The timing difference between the fastest and slowest output edges, including the t_{CO} variation and clock skew, across channels driven by the same PLL. The clock is included in the TCCS measurement (refer to the Timing Diagram figure under SW in this table). |
| t_{DUTY} | High-speed I/O block—Duty cycle on high-speed transmitter output clock. |
| t_{FALL} | Signal high-to-low transition time (80–20%) |
| t_{INCCJ} | Cycle-to-cycle jitter tolerance on the PLL clock input |
| t_{OUTPJ_IO} | Period jitter on the GPIO driven by a PLL |
| t_{OUTPJ_DC} | Period jitter on the dedicated clock output driven by a PLL |
| t_{RISE} | Signal low-to-high transition time (20–80%) |
| Timing Unit Interval (TUI) | The timing budget allowed for skew, propagation delays, and the data sampling window. (TUI = $1/(\text{Receiver Input Clock Frequency Multiplication Factor}) = t_c/w$). |
| $V_{CM(DC)}$ | DC Common mode input voltage. |
| V_{ICM} | Input Common mode voltage—The common mode of the differential signal at the receiver. |
| V_{ID} | Input differential voltage swing—The difference in voltage between the positive and complementary conductors of a differential transmission at the receiver. |
| $V_{DIF(AC)}$ | AC differential input voltage—Minimum AC input differential voltage required for switching. |
| $V_{DIF(DC)}$ | DC differential input voltage— Minimum DC input differential voltage required for switching. |
| V_{IH} | Voltage input high—The minimum positive voltage applied to the input which is accepted by the device as a logic high. |
| <i>continued...</i> | |

| Term | Definition |
|--------------|---|
| $V_{IH(AC)}$ | High-level AC input voltage |
| $V_{IH(DC)}$ | High-level DC input voltage |
| V_{IL} | Voltage input low—The maximum positive voltage applied to the input which is accepted by the device as a logic low. |
| $V_{IL(AC)}$ | Low-level AC input voltage |
| $V_{IL(DC)}$ | Low-level DC input voltage |
| V_{OCM} | Output Common mode voltage—The common mode of the differential signal at the transmitter. |
| V_{OD} | Output differential voltage swing—The difference in voltage between the positive and complementary conductors of a differential transmission line at the transmitter. |
| V_{SWING} | Differential input voltage |
| V_{IX} | Crossing point of differential signal  |
| V_{OX} | Output differential cross point voltage |
| W | High-speed I/O block—Clock Boost Factor |

Document Revision History for the Intel Arria 10 Device Datasheet

| Document Version | Changes |
|------------------|--|
| 2020.06.26 | Removed the note on HPS_PORSEL from t_{RAMP} in the <i>Recommended Operating Conditions for Intel Arria 10 Devices</i> table. HPS_PORSEL pin is not available for Intel Arria 10 devices. |
| 2020.03.20 | Corrected T_h from 10 ns to 0 ns in the <i>Management Data Input/Output (MDIO) Timing Requirements for Intel Arria 10 Devices</i> table. |
| 2019.06.24 | <ul style="list-style-type: none"> Updated the definitions for the power options. Updated the note to the speed grades in the <i>High-Speed I/O Specifications for Intel Arria 10 Devices</i> table. Updated the definition and added a waveform for V_{IX} in the <i>Glossary</i>. |
| 2018.11.29 | Removed t_R and t_F specifications in the <i>FPP Timing Parameters When the DCLK-to-DATA[] Ratio is >1 for Intel Arria 10 Devices</i> table. |
| 2018.09.24 | Removed specifications for automotive-grade devices (-A3 speed grade). |
| 2018.06.15 | <ul style="list-style-type: none"> Added <i>Intel Arria 10 Devices Overshoot Duration</i> figure and description. Removed <i>Equation for OCT Variation Without Recalibration</i>. Updated the descriptions for $T_{dssfrst}$, T_{dsslst}, T_{sur}, and T_h in the <i>Quad Serial Peripheral Interface (SPI) Flash Timing Requirements for Intel Arria 10 Devices</i> table. Updated the column header from "Minimum Number of Clock Cycles" to "Number of Clock Cycles for Initialization" in the <i>Initialization Clock Source Option and the Maximum Frequency for Intel Arria 10 Devices</i> table. |
| 2018.04.06 | <ul style="list-style-type: none"> Added notes to I_{OUT} specification in the <i>Absolute Maximum Ratings for Intel Arria 10 Devices</i> table. Updated the maximum frequency for DDR3L SDRAM in the <i>Memory Standards Supported by the HPS Hard Memory Controller for Intel Arria 10 Devices</i> table. |

| Date | Version | Changes |
|--------------|------------|--|
| January 2018 | 2018.01.09 | <ul style="list-style-type: none"> Added -E1H and -I1H speed grades. Removed -E2V and -I2V speed grades. Added a note to the -A3 speed grade to state that the specifications for automotive-grade devices are preliminary, pending characterization. Updated the <i>Recommended Operating Conditions for Intel Arria 10 Devices</i> table. <ul style="list-style-type: none"> Added a note to V_I Removed the note to T_j for Industrial and Automotive devices. Note removed: -40°C is only applicable to Start of Test, when the device is powered-on. The device does not stay at the minimum junction temperature for a long time. Updated the note to RSDS (HIO) and Mini-LVDS (HIO) in the <i>Differential I/O Standards Specifications for Intel Arria 10 Devices</i> table. |

continued...

| Date | Version | Changes |
|-----------|------------|---|
| | | <ul style="list-style-type: none"> • Added KDB link on PLL jitter compensation in the following tables: <ul style="list-style-type: none"> — Fractional PLL Specifications for Intel Arria 10 Devices — I/O PLL Specifications for Intel Arria 10 Devices • Corrected the clock name from "osc1 clock" to <code>osc1_clk</code> and added a note in the <i>HPS Reset Input Requirements for Intel Arria 10 Devices</i> table. • Added description about the <code>HPS_CLK1</code> pin in the <i>HPS PLL Input Requirements</i> section. • Updated the note for T_{su} and T_h in the <i>Secure Digital (SD)/MultiMediaCard (MMC) Timing Requirements for Intel Arria 10 Devices</i> table. • Updated the note to <code>CLKUSR</code> in the <i>Initialization Clock Source Option and the Maximum Frequency for Intel Arria 10 Devices</i> table. • Updated the <i>I/O Timing</i> section on the I/O timing information generation guidelines. • Updated the description and maximum offset values in the <i>IOE Programmable Delay for Intel Arria 10 Devices</i> table. |
| June 2017 | 2017.06.16 | <ul style="list-style-type: none"> • Added specifications for automotive-grade devices. • Removed -E1L and -I1L speed grades. • Clarified the voltage requirement footnote for PCIe Gen3 support in the "Transceiver Power Supply Operating Conditions for Intel Arria 10 GX/SX Devices" table. • Added notes for T_j for Industrial and Automotive devices in Recommended Operating Conditions for Intel Arria 10 Devices table. • Updated the description for V_{CCH_GXB} in the following tables: <ul style="list-style-type: none"> — Absolute Maximum Ratings for Intel Arria 10 Devices — Transceiver Power Supply Operating Conditions for Intel Arria 10 GX/SX Devices — Transceiver Power Supply Operating Conditions for Intel Arria 10 GT Devices • Added full pin names in the "Transceiver Power Supply Operating Conditions for Intel Arria 10 GX/SX Devices" table. • Clarified that the channel span for the x1 and x6 clock networks is six channels in a single bank in the "Transceiver Clock Network Maximum Data Rate Specifications" table. • Updated f_{VCO} specifications in Fractional PLL Specifications for Intel Arria 10 Devices table. • Updated the following tables to keep only the maximum frequencies: <ul style="list-style-type: none"> — Memory Standards Supported by the Hard Memory Controller for Intel Arria 10 Devices — Memory Standards Supported by the Soft Memory Controller for Intel Arria 10 Devices — Memory Standards Supported by the HPS Hard Memory Controller for Intel Arria 10 Devices • Updated the description for Memory Output Clock Jitter Specifications for Intel Arria 10 Devices table. |

| | | <ul style="list-style-type: none"> • Updated FPP Timing Parameters When the DCLK-to-DATA[] Ratio is 1 for Intel Arria 10 Devices table. <ul style="list-style-type: none"> – Updated the maximum value for t_{STATUS} and t_{CF2ST1} from 1,506 μs to 3,000 μs. – Updated f_{MAX} for FPP $\times 8/\times 16$ from 125 MHz to 100 MHz. – Updated the minimum value for t_{CF2CK} from 1,506 μs to 3,010 μs. – Updated the minimum value for t_{ST2CK} from 2 μs to 10 μs. – Updated the maximum value for t_{CD2UM} from 437 μs to 830 μs. • Updated FPP Timing Parameters When the DCLK-to-DATA[] Ratio is >1 for Intel Arria 10 Devices table. <ul style="list-style-type: none"> – Updated the maximum value for t_{STATUS} and t_{CF2ST1} from 1,506 μs to 3,000 μs. – Updated f_{MAX} for FPP $\times 8/\times 16$ from 125 MHz to 100 MHz. – Updated the minimum value for t_{CF2CK} from 1,506 μs to 3,010 μs. – Updated the minimum value for t_{ST2CK} from 2 μs to 10 μs. – Updated the maximum value for t_{CD2UM} from 437 μs to 830 μs. • Updated maximum value for t_{CD2UM} from 437 μs to 830 μs in AS Timing Parameters for AS $\times 1$ and AS $\times 4$ Configurations in Intel Arria 10 Devices table. • Updated PS Timing Parameters for Intel Arria 10 Devices table. <ul style="list-style-type: none"> – Updated the maximum value for t_{STATUS} and t_{CF2ST1} from 1,506 μs to 3,000 μs – Updated the minimum value for t_{CF2CK} from 1,506 μs to 3,010 μs. – Updated the minimum value for t_{ST2CK} from 2 μs to 10 μs. – Updated the maximum value for t_{CD2UM} from 437 μs to 830 μs. • Added description about <code>.rbf</code> and <code>.rpd</code> files in the Configuration Files section. Changed the table title from "Uncompressed Uncompressed .rbf Sizes Sizes for Intel Arria 10 Devices" to "Configuration Bit Stream Sizes for Intel Arria 10 Devices". • Updated the note to Active Serial in Minimum Configuration Time Estimation for Intel Arria 10 Devices table. Note: The minimum configuration time is calculated based on DCLK frequency of 100 MHz. Only external <code>CLKUSR</code> may guarantee the frequency accuracy of 100 MHz. If you use internal oscillator of 100 MHz, you may not get the actual frequency of 100 MHz. For the DCLK frequency using internal oscillator, refer to the DCLK Frequency Specification in the AS Configuration Scheme table. • Changed instances of <i>Quartus II</i> to <i>Quartus Prime</i>. • Changed voltages and conditions in the "Transceiver Power Supply Operating Conditions for Arria 10 GX/SX Devices" table. • Changed maximum data rate conditions in the "Transmitter and Receiver Data Rate Performance" table. • Changed conditions in the "Transmitter and Receiver Data Rate Performance" table in the <i>Transceiver Performance for Arria 10 GT Devices</i> section. • Changed conditions in the "Reference Clock Specifications" table. • Changed the clock networks in the "Transceiver Clock Network Maximum Data Rate Specifications" table. • Changed conditions in the "Receiver Specifications" table. • Changed conditions in the "Transmitter Specifications" table. • Changed the minimum frequency in the "ATX PLL Performance," "Fractional PLL Performance," and "CMU PLL Performance" tables in the <i>Transceiver Performance for Intel Arria 10 GX/SX Devices</i> section. |

| | | <ul style="list-style-type: none"> • Made the following changes to the "Transceiver Performance for Arria 10 GT Devices" section. <ul style="list-style-type: none"> – Added TX minimum data rate to the "Transmitter and Receiver Data Rate Performance" table. – Changed the maximum data rate condition for chip-to-chip and backplane in the "Transmitter and Receiver Data Rate Performance" table. – Changed the minimum frequency in the "ATX PLL Performance" table. – Changed the minimum frequency in the "Fractional PLL Performance" table. – Changed the minimum frequency in the "CMU PLL Performance" table. • Added voltage condition to the maximum peak-to-peak diff p-p after configuration and to the V_{ICM} specifications in the "Receiver Specifications" table. • Changed the voltage conditions for V_{OCM} in the "Transmitter Specifications" table. • Changed the V_{OD}/V_{CCT} Ratios in the "Typical Transmitter V_{OD} Settings" table. • Added the "Transceiver Clock Network Maximum Data Rate Specifications" table. |
| January 2015 | 2015.01.23 | <ul style="list-style-type: none"> • Added a note in the "Transceiver Power Supply Operating Conditions" section. • Made the following changes to the "Reference Clock Specifications" table: <ul style="list-style-type: none"> – Added the input reference clock frequency parameters for the CMU PLL, ATX PLL, and fPLL PLL. – Changed the maximum specification for rise time and fall time. – Added the V_{ICM} (AC and DC coupled) parameters. – Changed the maximum value for Transmitter REFCLK Phase Noise (622 MHz) when ≥ 1 MHz. • Changed the Min, Typ, and Max values for the <code>reconfig_clk</code> signal in the "Transceiver Clocks Specifications" table. • Made the following changes to the "Receiver Specifications" table: <ul style="list-style-type: none"> – Added the maximum peak-to-peak differential input voltage after device configuration specifications. – Changed the minimum specification for the minimum differential eye opening at receiver serial input pins parameter. – Removed the 120-ohm and 150-ohm conditions for the differential on-chip termination resistors parameter. – Added the V_{ICM} (AC and DC coupled) parameter. – Added the Programmable DC Gain parameter. • Made the following changes to the "Transmitter Specifications" table: <ul style="list-style-type: none"> – Added the V_{OCM} (AC coupled) parameter. – Added the V_{OCM} (DC coupled) parameter. – Changed the rise and fall time minimum and maximum specifications. • Added the "Typical Transmitter V_{OD} Settings" table. • Added a note to V_{CC}, V_{CCP}, and V_{CCERAM} typical values in Recommended Operating Conditions table. Note: You can operate -1 and -2 speed grade devices at 0.9 V or 0.95 V typical value. You can operate -3 speed grade device at only 0.9 V typical value. Core performance shown in this datasheet is applicable for the operation at 0.9 V. Operating at 0.95 V results in higher core performance and higher power consumption. For more information about the performance and power consumption of 0.95 V operation, refer to the Intel Quartus Prime software timing reports and Early Power Estimator (EPE). • Removed military grade operating junction temperature specifications (T_J) in Recommended Operating Conditions table. |
