## Intel® Arria® 10 Device Datasheet

---

This datasheet describes the electrical characteristics, switching characteristics, configuration specifications, and I/O timing for Intel® Arria® 10 devices.

Intel Arria 10 devices are offered in extended and industrial grades. Extended devices are offered in -E1 (fastest), -E2, and -E3 speed grades. Industrial grade devices are offered in the -I1, -I2, and -I3 speed grades.

The suffix after the speed grade denotes the power options offered in Intel Arria 10 devices.

- L—enables the device to operate at low static power while maintaining excellent performance.
- S—standard power specification.
- V—enables the device to run at lower than default  $V_{CC}$ , reducing static and dynamic power while retaining equivalent performance.
- H—small device with high performance at the fastest speed grade (-1).

## Electrical Characteristics

The following sections describe the operating conditions and power consumption of Intel Arria 10 devices.

## Operating Conditions

Intel Arria 10 devices are rated according to a set of defined parameters. To maintain the highest possible performance and reliability of the Intel Arria 10 devices, you must consider the operating requirements described in this section.

## Absolute Maximum Ratings

This section defines the maximum operating conditions for Intel Arria 10 devices. The values are based on experiments conducted with the devices and theoretical modeling of breakdown and damage mechanisms. The functional operation of the device is not implied for these conditions.

**Caution:** Conditions outside the range listed in the following table may cause permanent damage to the device. Additionally, device operation at the absolute maximum ratings for extended periods of time may have adverse effects on the device.

**Table 1. Absolute Maximum Ratings for Intel Arria 10 Devices**

### Maximum Allowed Overshoot and Undershoot Voltage

During transitions, input signals may overshoot to the voltage listed in the following table and undershoot to -2.0 V for input currents less than 100 mA and periods shorter than 20 ns.

The maximum allowed overshoot duration is specified as a percentage of high time over the lifetime of the device. A DC signal is equivalent to 100% duty cycle.

For example, a signal that overshoots to 2.70 V for LVDS I/O can only be at 2.70 V for ~4% over the lifetime of the device.

- 
- (2) The maximum current allowed through any LVDS I/O bank pin when the device is not turned on or during power-up/power-down conditions is 10 mA.
  - (3) Total current per LVDS I/O bank must not exceed 100 mA.
  - (4) Voltage level must not exceed 1.89 V.
  - (5) Applies to all I/O standards and settings supported by LVDS I/O banks, including single-ended and differential I/Os.
  - (6) Applies only to LVDS I/O banks. 3 V I/O banks are not covered under this specification and must be implemented as per the power sequencing requirement. For more details, refer to *AN 692: Power Sequencing Considerations for Intel Cyclone® 10 GX, Intel Arria 10, and Intel Stratix® 10 Devices* and *Power Management in Intel Arria 10 Devices chapter*.

**Table 2. Maximum Allowed Overshoot During Transitions for Intel Arria 10 Devices**

This table lists the maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage of device lifetime. The LVDS I/O values are applicable to the VREFP\_ADC and VREFN\_ADC I/O pins.

Symbol	Description	Condition (V)		Overshoot Duration as % at T <sub>J</sub> = 100°C	Unit
		LVDS I/O <sup>(7)</sup>	3 V I/O		
Vi (AC)	AC input voltage	2.50	3.80	100	%
		2.55	3.85	42	%
		2.60	3.90	18	%
		2.65	3.95	9	%
		2.70	4.00	4	%
		> 2.70	> 4.00	No overshoot allowed	%

For an overshoot of 2.5 V, the percentage of high time for the overshoot can be as high as 100% over a 10-year period. Percentage of high time is calculated as  $([\Delta T]/T) \times 100$ . This 10-year period assumes that the device is always turned on with 100% I/O toggle rate and 50% duty cycle signal.

<sup>(7)</sup> The LVDS I/O values are applicable to all dedicated and dual-function configuration I/Os.

- <sup>(8)</sup> This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.
- <sup>(9)</sup> You can operate –1 and –2 speed grade devices at 0.9 V or 0.95 V typical value. You can operate –3 speed grade device only at 0.9 V typical value. Operating at 0.95 V results in higher core performance and higher power consumption. Refer to core performance in this datasheet for different typical values. For more information about the power consumption of different typical values, refer to the Intel Quartus® Prime software, Power Analyzer report, and Early Power Estimator (EPE).
- <sup>(10)</sup> SmartVID is supported in devices with –3V speed grades only.
- <sup>(11)</sup> If you do not use the design security feature in Intel Arria 10 devices, connect V<sub>CCBAT</sub> to a 1.5-V to 1.8-V power supply. Intel Arria 10 power-on reset (POR) circuitry monitors V<sub>CCBAT</sub>. Intel Arria 10 devices do not exit POR if V<sub>CCBAT</sub> is not powered up.

<sup>(8)</sup> This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

<sup>(15)</sup> t<sub>ramp</sub> is the ramp time of each individual power supply, not the ramp time of all combined power supplies.

<sup>(16)</sup> These data rate ranges vary depending on the transceiver speed grade. Refer to Transceiver Performance for Intel Arria 10 GX/SX Devices for exact data rate ranges.

<sup>(17)</sup> This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

<sup>(18)</sup> To support PCIe\* Gen3, this pin must be 1.03 V (± 30 mV) or higher.

<sup>(19)</sup> Backplane applications assume advanced equalization circuitry, such as decision feedback equalization (DFE), is enabled to compensate for signal impairments. Chip-to-chip links are assumed to be applications with short reach channels that do not require DFE.

## HPS Power Supply Operating Conditions

**Table 6. HPS Power Supply Operating Conditions for Intel Arria 10 SX Devices**

This table lists the steady-state voltage and current values expected from Intel Arria 10 system-on-a-chip (SoC) devices with ARM\*-based hard processor system (HPS). Power supply ramps must all be strictly monotonic, without plateaus. Refer to Recommended Operating Conditions for Intel Arria 10 Devices table for the steady-state voltage values expected from the FPGA portion of the Intel Arria 10 SoC devices.

## DC Characteristics

### Supply Current and Power Consumption

Intel offers two ways to estimate power for your design—the Excel-based Early Power Estimator (EPE) and the Intel Quartus Prime Power Analyzer feature.

<sup>(22)</sup> This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

<sup>(23)</sup> V<sub>CCL\_HPS</sub> options are valid under the operating conditions specified in the Maximum HPS Clock Frequencies table.

Use the Excel-based EPE before you start your design to estimate the supply current for your design. The EPE provides a magnitude estimate of the device power because these currents vary greatly with the usage of the resources.

The Intel Quartus Prime Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yield very accurate power estimates.

## I/O Standard Specifications

Tables in this section list the input voltage ( $V_{IH}$  and  $V_{IL}$ ), output voltage ( $V_{OH}$  and  $V_{OL}$ ), and current drive characteristics ( $I_{OH}$  and  $I_{OL}$ ) for various I/O standards supported by Intel Arria 10 devices.

For minimum voltage values, use the minimum  $V_{CCIO}$  values. For maximum voltage values, use the maximum  $V_{CCIO}$  values.

You must perform timing closure analysis to determine the maximum achievable frequency for general purpose I/O standards.

<sup>(50)</sup> The differential eye opening specification at the receiver input pins assumes that Receiver Equalization is disabled. If you enable Receiver Equalization, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.

<sup>(51)</sup> Intel Arria 10 devices only support DC coupling when using the Hybrid Memory Cube (HMC) or the Intel QuickPath Interconnect (QPI) specifications.

<sup>(52)</sup>  $t_{LTR}$  is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.

<sup>(53)</sup>  $t_{LTD}$  is time required for the receiver CDR to start recovering valid data after the `rx_is_lockedto data` signal goes high.

Programmable AC Gain at High Data Rate mode	Setting = 0-15	0	—	8	dB

(54)  $t_{LTD\_manual}$  is the time required for the receiver CDR to start recovering valid data after the `rx_is_lockedtodata` signal goes high when the CDR is functioning in the manual mode.

(55)  $t_{LTR\_LTD\_manual}$  is the time the receiver CDR must be kept in lock to reference (LTR) mode after the `rx_is_lockedtoref` signal goes high when the CDR is functioning in the manual mode.

<sup>(56)</sup> High Speed Differential I/O is the dedicated I/O standard for the transmitter in Intel Arria 10 transceivers.

<sup>(57)</sup> The Intel Quartus Prime software automatically selects the appropriate slew rate depending on the design configurations.

<sup>(58)</sup> In QPI mode, if V<sub>CM</sub> < 0.17 V, the input Vid must be greater than 100 mV. If V<sub>CM</sub> > 0.17 V, the input Vid must be greater than 70 mV.

<sup>(59)</sup> SLEW\_R1 is the slowest and SLEW\_R5 is the fastest. SLEW\_R6 and SLEW\_R7 are not used.

- [KDB link: How do I compensate for the jitter of PLL cascading or non-dedicated clock path for Intel Arria 10 PLL reference clock?](#)  
For the Intel Quartus Prime software version prior to 17.1, the fPLL output may experience additional jitter. The additional jitter occurs if you source the reference clock from a cascaded PLL output, global clock, or core clock. To compensate for the jitter, the designs require additional constraints. This issue has been fixed in the Intel Quartus Prime software version 17.1.

<sup>(64)</sup> A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source with jitter < 120 ps.

### Memory Block Specifications

To achieve the maximum memory block performance, use a memory block clock that comes through global clock routing from an on-chip PLL and set to **50%** output duty cycle. Use the Intel Quartus Prime software to report timing for the memory block clocking schemes.

When you use the error detection cyclical redundancy check (CRC) feature, there is no degradation in  $f_{MAX}$ .

## Peripheral Performance Specifications

This section describes the peripheral performance, high-speed I/O, and external memory interface.

Actual achievable frequency depends on design and system specific factors. Ensure proper timing closure in your design and perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

## High-Speed I/O Specifications

**Table 47. High-Speed I/O Specifications for Intel Arria 10 Devices**

When serializer/deserializer (SERDES) factor J = 3 to 10, use the SERDES block.

For LVDS applications, you must use the PLLs in integer PLL mode.

You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine the leftover timing margin.

The Intel Arria 10 devices support the following output standards using true LVDS output buffer types on all I/O banks:

- True RSDS output standard with data rates of up to 360 Mbps
- True mini-LVDS output standard with data rates of up to 400 Mbps

- (74) Requires package skew compensation with PCB trace length.
- (75) The  $F_{\text{max}}$  specification is based on the fast clock used for serial data. The interface  $F_{\text{max}}$  is also dependent on the parallel clock domain which is design dependent and requires timing analysis.
- (76) The  $V_{\text{CC}}$  and  $V_{\text{CCP}}$  must be on a combined power layer and a maximum load of 5 pF for chip-to-chip interface.
- (77) The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and serializer do not have a minimum toggle rate.
- (78) The maximum ideal data rate is the SERDES factor (J) x the PLL maximum output frequency ( $f_{\text{OUT}}$ ) provided you can close the design timing and the signal integrity meets the interface requirements.

## DLL Range Specifications

**Table 53. DLL Frequency Range Specifications for Intel Arria 10 Devices**

Intel Arria 10 devices support memory interface frequencies lower than 600 MHz, although the reference clock that feeds the DLL must be at least 600 MHz. To support interfaces below 600 MHz, multiply the reference clock feeding the DLL to ensure the frequency is within the supported range.

## Memory Output Clock Jitter Specifications

**Table 55. Memory Output Clock Jitter Specifications for Intel Arria 10 Devices**

The clock jitter specification applies to the memory output clock pins clocked by an I/O PLL, or generated using differential signal-splitter and double data I/O circuits clocked by a PLL output routed on a PHY clock network as specified. Intel recommends using PHY clock networks for better jitter performance.

The memory output clock jitter is applicable when an input jitter of 10 ps peak-to-peak is applied with bit error rate (BER)  $10^{-12}$ , equivalent to 14 sigma.

### SPI Timing Characteristics

**Table 63. SPI Master Timing Requirements for Intel Arria 10 Devices**

You can adjust the input delay timing by programming the `rx_sample_dly` register.

Symbol	Description	Min	Typ	Max	Unit
$T_{clk}$	SPI_CLK clock period	16.67	—	—	ns
$T_{dutycycle}$	SPI_CLK duty cycle	45	50	55	%

$T_{dsslst}^{(89)}$	Last SPI_CLK edge to SPI_SS deasserted	$T_{SPI\_CLK} - 2$	—	—	ns
$T_{dio}$	Master-out slave-in (MOSI) output delay	-1	—	1	ns

*continued...*

<sup>(89)</sup> SPI\_SS behavior differs depending on Motorola SPI, TI SSP or Microwire operational mode.

Symbol	Description	Min	Typ	Max	Unit
$T_{su}^{(90)}$	Input setup in respect to SPI_CLK capture edge	16 - $(rx\_sample\_dly$ $\times T_{spi\_ref\_clk})^{(91)}$ $^{(92)}$	—	—	ns
$T_h^{(90)}$	Input hold in respect to SPI_CLK capture edge	0	—	—	ns
$T_{dssb2b}$	Minimum delay of slave select deassertion between two back-to-back transfers (frames)	1	—	—	SPI_CLK

<sup>(90)</sup> The capture edge differs depending on the operational mode. For Motorola SPI, the capture edge can be the rising or falling edge depending on the `scpol` register bit; for TI SSP, the capture edge is the falling edge; for Microwire, the capture edge is the rising edge.

<sup>(91)</sup> A `rx_sample_dly` value of 0 is an invalid setting.

<sup>(92)</sup> `SPI_REF_CLK` is the internal reference clock of the SPI Slave, which is `l4_main_clk`.

## SD/MMC Timing Characteristics

**Table 65. Secure Digital (SD)/MultiMediaCard (MMC) Timing Requirements for Intel Arria 10 Devices**

These timings apply to SD, MMC, and embedded MMC cards operating at 1.8 V and 3.0 V.

Symbol	Description	Min	Typ	Max	Unit
T <sub>sdmmc_cclk</sub>	SDMMC_CCLK clock period (Identification mode)	—	2500	—	ns
	SDMMC_CCLK clock period (Standard SD mode)	—	40	—	ns
	SDMMC_CCLK clock period (High speed SD mode)	—	20	—	ns
T <sub>dutycycle</sub>	SDMMC_CCLK duty cycle	45	50	55	%
T <sub>su</sub>	SDMMC_CMD/SDMMC_D[7:0] input setup <sup>(94)</sup>	$7 - (14\_mp\_clk \times smp1sel/2)$	—	—	ns
T <sub>h</sub>	SDMMC_CMD/SDMMC_D[7:0] input hold <sup>(94)</sup>	$-2.5 + (14\_mp\_clk \times smp1sel/2)$	—	—	ns
T <sub>d</sub>	SDMMC_CMD/SDMMC_D[7:0] output delay <sup>(95)</sup>	$-1 + (14\_mp\_clk \times drvsel/2)$ <sup>(96)</sup>	—	$4 + (14\_mp\_clk \times drvsel/2)$ <sup>(96)</sup>	ns

<sup>(94)</sup> When `smp1sel` is set to 2 (in the system manager) and the reference clock (`14_mp_clk`) is 200 MHz for example, the setup time is 2 ns and the hold time is 2.5 ns. The Boot ROM uses a `smp1sel` setting of 0 and U-Boot can adjust this setting later in the boot process.

<sup>(95)</sup> When `drvsel` is set to 3 (in the system manager) and the reference clock (`14_mp_clk`) is 200 MHz for example, the output delay time is 6.5 to 11.5 ns. The Boot ROM uses a `drvsel` setting of 3 and the Intel Quartus Prime software can adjust this setting later in the boot process. `drvsel` set to 0 is not a valid setting.

<sup>(96)</sup> `14_mp_clk` is the SD/MMC controller reference clock.

### Trace Timing Characteristics

Table 75. Trace Timing Requirements for Intel Arria 10 Devices

To increase the trace bandwidth, Intel recommends routing the trace interface to the FPGA in the HPS Platform Designer (Standard) component. The FPGA trace interface offers a 32-bit single data rate path that can be converted to double data rate to minimize FPGA I/O usage.

Depending on the trace module that you connect to the HPS trace interface, you may need to include board termination to achieve the maximum sampling speed possible. Refer to your trace module datasheet for termination recommendations.

## GPIO Interface

The general-purpose I/O (GPIO) interface has debounce circuitry included to remove signal glitches. The debounce clock frequency ranges from 125 Hz to 32 kHz. The minimum pulse width is one debounce clock cycle and the minimum detectable GPIO pulse width is 62.5  $\mu$ s (at 32 kHz). Any pulses shorter than two debounce clock cycles are filtered by the GPIO peripheral.

If the external signal is less than one clock cycle, the external signal is filtered. If the external signal is between one and two clock cycles, the external signal may or may not be filtered depending on the phase of the signal. If the external signal is more than two clock cycles, the external signal will not be filtered.

To ensure that the external signal is correctly debounced, set the debounce clock low enough so that by the time two debounce clock periods have passed, the signal has settled.

## Configuration Specifications

This section provides configuration specifications and timing for Intel Arria 10 devices.

## POR Specifications

Power-on reset (POR) delay is defined as the delay between the time when all the power supplies monitored by the POR circuitry reach the minimum recommended operating voltage to the time when the `nSTATUS` is released high and your device is ready to begin configuration.

## FPP Configuration Timing

### DCLK-to-DATA[] Ratio (r) for FPP Configuration

Fast passive parallel (FPP) configuration requires a different DCLK-to-DATA[] ratio when you turn on encryption or the compression feature.

Depending on the DCLK-to-DATA[] ratio, the host must send a DCLK frequency that is  $r$  times the DATA[] rate in byte per second (Bps) or word per second (Wps). For example, in FPP  $\times 16$  where the  $r$  is 2, the DCLK frequency must be 2 times the DATA[] rate in Wps.

**Table 78. DCLK-to-DATA[] Ratio for Intel Arria 10 Devices**

You cannot turn on encryption and compression at the same time for Intel Arria 10 devices.

Configuration Scheme	Encryption	Compression	DCLK-to-DATA[] Ratio (r)
FPP (8-bit wide)	Off	Off	1
	On	Off	1
	Off	On	2
FPP (16-bit wide)	Off	Off	1
	On	Off	2
	Off	On	4
FPP (32-bit wide)	Off	Off	1
	On	Off	4
	Off	On	8

### FPP Configuration Timing when DCLK-to-DATA[] = 1

**Note:** When you enable decompression or the design security feature, the DCLK-to-DATA[] ratio varies for FPP  $\times 8$ , FPP  $\times 16$ , and FPP  $\times 32$ . For the respective DCLK-to-DATA[] ratio, refer to the DCLK-to-DATA[] Ratio for Intel Arria 10 Devices table.

## DCLK Frequency Specification in the AS Configuration Scheme

**Table 82. DCLK Frequency Specification in the AS Configuration Scheme**

This table lists the internal clock frequency specification for the AS configuration scheme.

The DCLK frequency specification applies when you use the internal oscillator as the configuration clock source.

The AS multi-device configuration scheme does not support DCLK frequency of 100 MHz.

You can only set 12.5, 25, 50, and 100 MHz in the Intel Quartus Prime software.

Parameter	Minimum	Typical	Maximum	Intel Quartus Prime Software Settings	Unit
DCLK frequency in AS configuration scheme	5.3	7.5	9.7	12.5	MHz
	10.5	15.0	19.3	25.0	MHz
	21.0	30.0	38.5	50.0	MHz
	42.0	60.0	77.0	100.0	MHz

## PS Configuration Timing

<sup>(123)</sup> This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.

<sup>(124)</sup> This value is applicable if you do not delay configuration by externally holding the nSTATUS low.

<sup>(125)</sup> If nSTATUS is monitored, follow the t<sub>ST2CK</sub> specification. If nSTATUS is not monitored, follow the t<sub>CF2CK</sub> specification.

## Initialization

**Table 84. Initialization Clock Source Option and the Maximum Frequency for Intel Arria 10 Devices**

Initialization Clock Source	Configuration Scheme	Maximum Frequency (MHz)	Number of Clock Cycles for Initialization
Internal Oscillator	AS, PS, and FPP	12.5	600
CLKUSR <sup>(127)(128)</sup>	AS, PS, and FPP	100	

## Configuration Files

There are two types of configuration bit stream formats for different configuration schemes:

- PS and FPP—Raw Binary File (.rbf)
- AS—Raw Programming Data File (.rpd)

<sup>(126)</sup> The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.

<sup>(127)</sup> To enable CLKUSR as the initialization clock source, in the Intel Quartus Prime software, select **Device and Pin Options > General > Device initialization clock source > CLKUSR pin**.

<sup>(128)</sup> If you use the CLKUSR pin for AS and transceiver calibration simultaneously, the only allowed frequency is 100 MHz.

The .rpd file size follows the Intel configuration devices capacity. However, the actual configuration bit stream size for .rpd file is the same as .rbf file.

**Table 85. Configuration Bit Stream Sizes for Intel Arria 10 Devices**

Use this table to estimate the file size before design compilation. Different configuration file formats, such as a hexadecimal file (.hex) or tabular text file (.ttf) format, have different file sizes.

For the different types of configuration file and file sizes, refer to the Intel Quartus Prime software. However, for a specific version of the Intel Quartus Prime software, any design targeted for the same device has the same uncompressed configuration file size.

I/O configuration shift register (IOCSR) is a long shift register that facilitates the device I/O peripheral settings. The IOCSR bit stream is part of the uncompressed configuration bit stream, and it is specifically for the Configuration via Protocol (CvP) feature.

Uncompressed configuration bit stream sizes are subject to change for improvements and optimizations in the configuration algorithm.

<sup>(129)</sup> The minimum configuration time is calculated based on DCLK frequency of 100 MHz. Only external CLKUSR may guarantee the frequency accuracy of 100 MHz. If you use internal oscillator of 100 MHz, you may not get the actual frequency of 100 MHz. For the DCLK frequency using internal oscillator, refer to the DCLK Frequency Specification in the AS Configuration Scheme table.

## I/O Timing

I/O timing data is typically used prior to designing the FPGA to get an estimate of the timing budget as part of the timing analysis. You may generate the I/O timing report manually using the Timing Analyzer or using the automated script.

- 
- <sup>(131)</sup> This clock is user-supplied to the remote system upgrade circuitry. If you are using the Remote Update Intel FPGA IP core, the clock user-supplied to the Remote Update Intel FPGA IP core must meet this specification.

- <sup>(133)</sup> This is equivalent to strobing the reset\_timer input of the Remote Update Intel FPGA IP core high for the minimum timing specification.

The Intel Quartus Prime Timing Analyzer provides a more accurate and precise I/O timing data based on the specifics of the design after you complete place-and-route.
