Overview

Chirp chirp! Make this delightful sound-making plush toy with the Sew-Your-Own Owl Kit (http://adafru.it/1728) and GEMMA plush toy guts kit (http://adafru.it/1759). This simple circuit uses a tilt ball switch to trigger GEMMA to play a sound on the small speaker. You can program your own circuit to make other sounds too, so you can even mod a plush toy you already have!

This is a beginner level sewing and soldering project. This tutorial has detailed photos for each step of circuit assembly and installing the circuit into the toy, and the owl kit comes with detailed printed instructions recommended for slightly experienced stitchers as young as eight.

This guide was written for the Gemma v1 and v2 boards. It can also be done with the Gemma M0. We recommend the Gemma M0 as it is easier to use and is more compatible with modern computers! The wiring is the same.

Click to enlarge this circuit diagram, and refer back to it throughout the building of your circuit!

© Adafruit Industries Page 3 of 31

Tools & Supplies

Your GEMMA plush toy guts kit (http://adafru.it/1759) includes:

- Adafruit Gemma MO (https://adafru.it/ytb) or Adafruit GEMMA (https://adafru.it/
- 150mAh lipoly battery (http://adafru.it/1317)
- Micro Lipo charger (http://adafru.it/1304)
- PN2222 transistor (http://adafru.it/756)

© Adafruit Industries Page 4 of 31

- Tilt ball switch (http://adafru.it/173)
- 220 ohm resistor
- small speaker
- 24 inches of solid core wire (http://adafru.it/290)
- three sizes of heat shrink tubing (http://adafru.it/344)

You will also need the <u>Sew-Your-Own Owl Kit</u> (http://adafru.it/1728) or an existing plush toy to mod.

In addition to the above materials, you should have the following tools on hand to complete this project:

© Adafruit Industries Page 5 of 31

Any entry level 'all-in-one' soldering iron that you might find at your local hardware store should work. As with most things in life, you get what you pay for.

Upgrading to a higher end soldering iron setup, like the Hakko FX-888 that we stock in our store (http://adafru.it/180), will make soldering fun and easy.

Do not use a "ColdHeat" soldering iron!
They are not suitable for delicate
electronics work and can damage the
boards (see here (https://adafru.it/aOo)).

Click here to buy our entry level adjustable 30W 110V soldering iron. (http://adafru.it/180)

Click here to upgrade to a Genuine Hakko FX-888 adjustable temperature soldering iron. (http://adafru.it/303)

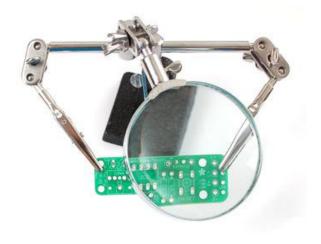

Learn how to solder with tons of tutorials! (https://adafru.it/aTk)

You will want rosin core, 60/40 solder. Good solder is a good thing. Bad solder leads to bridging and cold solder joints which can be tough to find.

Click here to buy a spool of leaded solder (recommended for beginners). (http://adafru.it/145)

© Adafruit Industries Page 6 of 31

A helping third hand tool really makes this project a joy to build.

Click here to buy a helping third hand tool. (http://adafru.it/291)

Don't forget your wire strippers (http://adafru.it/527)!

You'll need a pair of flush snips (http://adafru.it/152).

© Adafruit Industries Page 7 of 31

Sharp scissors are a must!

You will need a good quality basic multimeter that can measure voltage and continuity.

Click here to buy a basic multimeter. (http://adafru.it/71)

Click here to buy a top of the line multimeter. (http://adafru.it/308)

Click here to buy a pocket multimeter. (http://adafru.it/850)

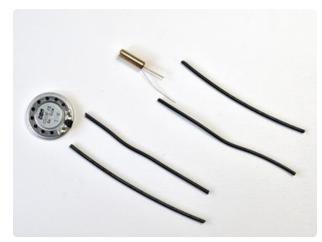

Don't forget to learn how to use your multimeter too! (https://adafru.it/aOy)

NOZA E MAY RE IN

Heat gun or lighter to shrink your heat shrink tubing!

© Adafruit Industries Page 8 of 31

Solder Circuit

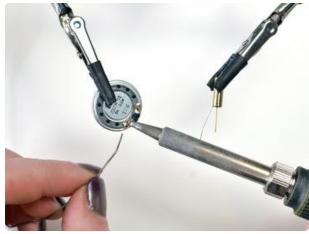

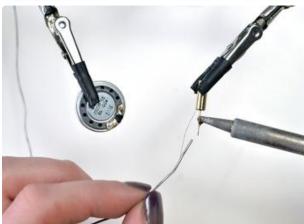

Start by preparing the speaker and tilt ball switch.

Cut five pieces of wire about four inches in length each.

Use wire strippers to strip the insulation off the last quarter inch of each end of each wire.

© Adafruit Industries Page 9 of 31

Place the small speaker and tilt ball switch in the jaws of a helping hand tool.

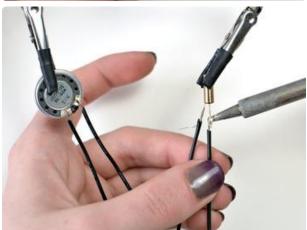

Use a soldering iron to heat up one of the pads of the small speaker.

Apply a small amount of solder to the heated pad to tin it. This will make it easier to attach a wire in the next step.

Repeat to tin the other speaker pad and the two legs of the tilt ball switch.

© Adafruit Industries Page 10 of 31

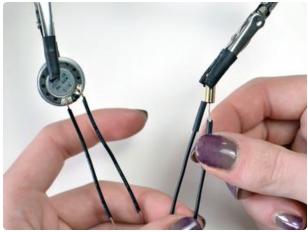

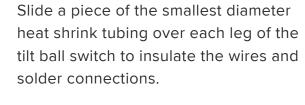

Hold a wire up to the speaker's pad and reheat the solder with your soldering iron. Hold it to the joint until the solder flows around the wire, then remove heat and hold the wire until the solder solidifies.

Repeat to solder wires to the the other speaker pad and both legs of the tilt ball switch.

Snip off any excess wire.

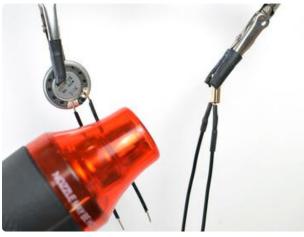

© Adafruit Industries Page 11 of 31

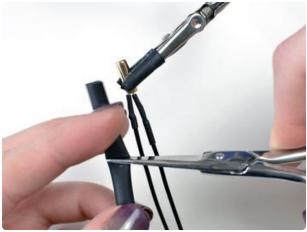

Use a heat gun to shrink the tubing.

Cut a piece of larger heat shrink tubing and slide over the entire tilt ball switch and wire connections; heat to shrink.

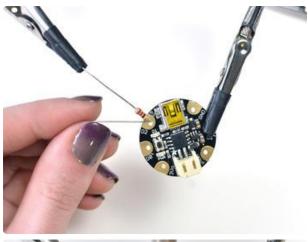

© Adafruit Industries Page 12 of 31

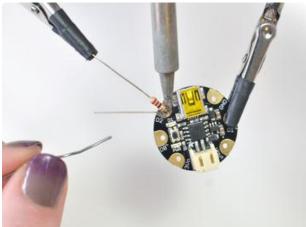

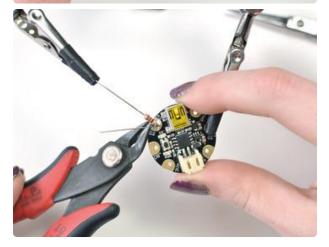

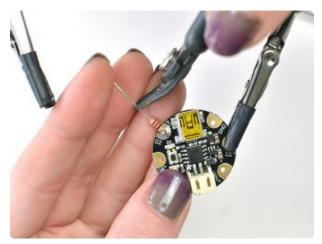

Your speaker and tilt ball switch are now ready for attaching to the rest of your circuit!

© Adafruit Industries Page 13 of 31

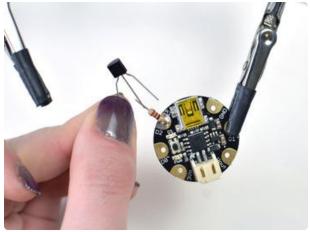

Now get GEMMA set up in your helping hand tool.

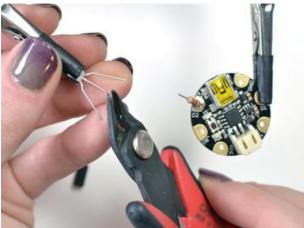

Insert one of the legs of the 220 ohm resistor into the pin marked D2 on GEMMA.

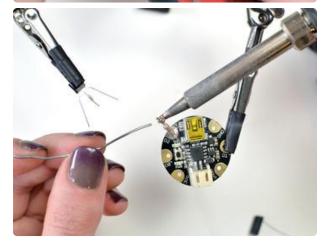

Solder in place.

Snip off the extra wire lead and cut the free-hanging wire lead to half its length.

© Adafruit Industries Page 14 of 31

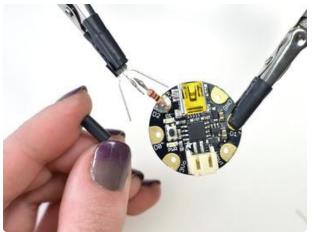

Next it's time to connect up the center leg of the transistor.

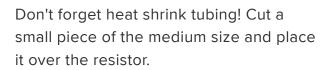

Pay close attention to the orientation of the transistor. The flat side should face the same direction as the front of GEMMA.

Clip the transistor's center lead shorter and set up the component in your helping hand tool.

Tin the lead of the resistor and the center lead of the transistor.

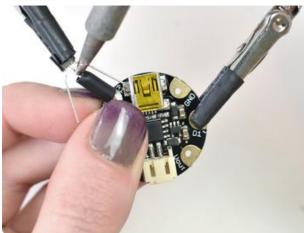

© Adafruit Industries Page 15 of 31

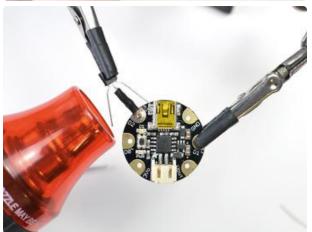

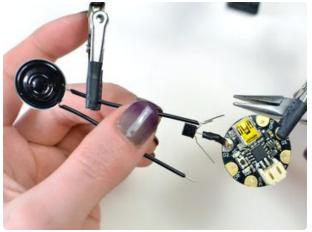

Position the leads next to each other and carefully solder in place.

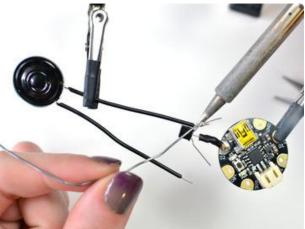

Heat the tubing to shrink it down.

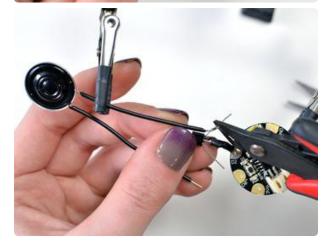

© Adafruit Industries Page 16 of 31

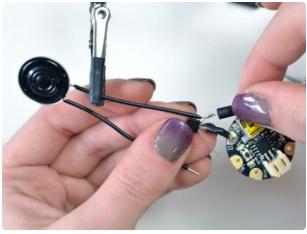

Set up the speaker in your helping hand tool and position one of its wire leads next to the transistor lead on the right.

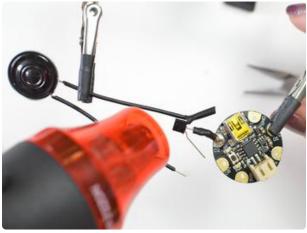

Twist the wires together and solder.

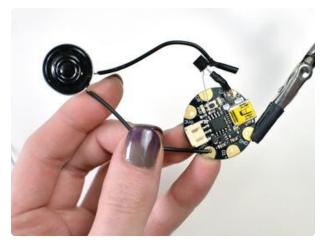

Snip off any excess and slide a piece of heat shrink tubing over the connection.

Heat to shrink in place.

© Adafruit Industries Page 17 of 31

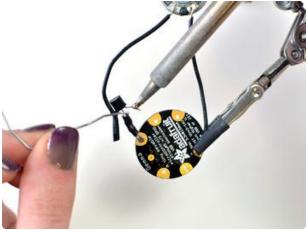

Bend the speaker's other wire to the Vout pin on GEMMA and solder in place.

Clip off any excess wire.

© Adafruit Industries Page 18 of 31

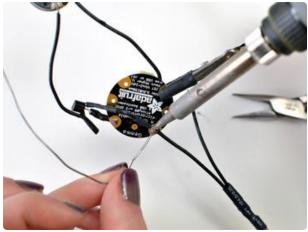

Tin the last remaining lead of the transistor and solder to a piece of wire.

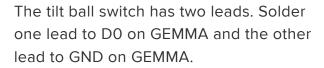

Slide on some heat shrink and use a heat gun to shrink it.

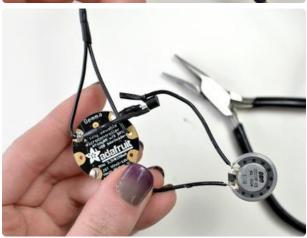

© Adafruit Industries Page 19 of 31

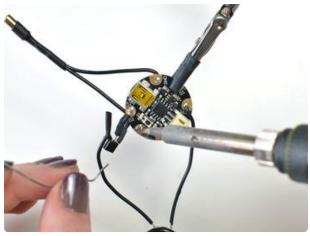

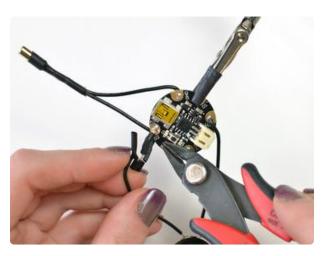

Solder both of these wires to the pad of the circuit board together.

Clip off any excess wire.

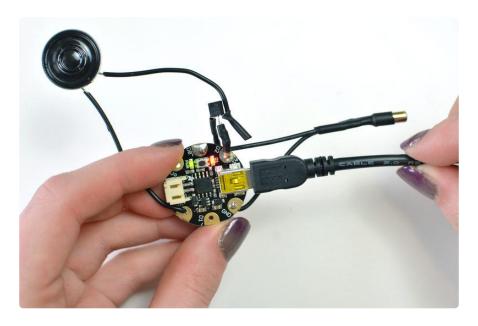

© Adafruit Industries Page 20 of 31

Your circuit is complete! Look it over, comparing it to the circuit diagram and double checking your solder joints.

Arduino Code

The Arduino code presented below works equally well on all versions of GEMMA: v1, v2 and M0. But if you have an M0 board, consider using the CircuitPython code on the next page of this guide, no Arduino IDE required!

© Adafruit Industries Page 21 of 31

Plug GEMMA into your computer with a USB cable. If you've never programmed GEMMA before, you'll have to download and install the special Adafruit version of the Arduino IDE, which you can find in the Introducing GEMMA guide (https://adafru.it/cHH). Once you're able to load programs onto GEMMA successfully, load up the following code:

 This example code is in the public domain.
 http://www.arduino.cc/en/Tutorial/Debounce
// constants won't change. They're used here to
// set pin numbers:
const int buttonPin = 0;  // the number of the pushbutton pin
const int speakerPin = 2;  // the number of the LED pin
const int ledPin = 1;
// Variables will change:
int ledState = HIGH;
// the following variables are long's because the time, measured in miliseconds,
// will quickly become a bigger number than can be stored in an int.
long lastDebounceTime = 0; // the last time the output pin was toggled
long debounceDelay = 50;  // the debounce time; increase if the output flickers
void setup() {
  pinMode(buttonPin, INPUT_PULLUP);
  pinMode(speakerPin, OUTPUT);
  //digitalWrite(speakerPin, HIGH);
  digitalWrite(ledPin, LOW);
  //digitalWrite(buttonPin, HIGH);
  // set initial LED state
  //digitalWrite(speakerPin, ledState);
  //Serial.begin(9600);
void loop() {
  // read the state of the switch into a local variable:
  int reading = digitalRead(buttonPin);
  // check to see if you just pressed the button
  // (i.e. the input went from LOW to HIGH), and you've waited
  // long enough since the last press to ignore any noise:
  // If the switch changed, due to noise or pressing:
  if (reading != lastButtonState) {
    // reset the debouncing timer
    lastDebounceTime = millis();
```

© Adafruit Industries Page 22 of 31

```
if ((millis() - lastDebounceTime) > debounceDelay) {
    // whatever the reading is at, it's been there for longer
    // than the debounce delay, so take it as the actual current state:
    // if the button state has changed:
    if (reading != buttonState) {
      buttonState = reading;
      // only toggle the LED if the new button state is HIGH
      //Serial.println("chirp");
        chirp(); // change this line to change animal sound
        //meow();
        //meow2();
        ///mew();
        //ruff();
        //arf();
    }
  }
  // set the LED:
  //digitalWrite(speakerPin, ledState);
  // save the reading. Next time through the loop,
  // it'll be the lastButtonState:
  lastButtonState = reading;
// Generate the Bird Chirp sound
void chirp() {
 for(uint8_t i=200; i>180; i--)
   playTone(i,9);
// Play a tone for a specific duration. value is not frequency to save some
   cpu cycles in avoiding a divide.
void playTone(int16_t tonevalue, int duration) {
  for (long i = 0; i < duration * 1000L; i += tonevalue * 2) {</pre>
   digitalWrite(speakerPin, HIGH);
   delayMicroseconds(tonevalue);
   digitalWrite(speakerPin, LOW);
   delayMicroseconds(tonevalue);
}
void meow() { // cat meow (emphasis ow "me")
  uint16 t i;
  playTone(5100,50);
                             // "m" (short)
                             // "eee" (long)
  playTone(394,180);
  for(i=990; i<1022; i+=2) // vary "ooo" down</pre>
     playTone(i,8);
                             // "w" (short)
  playTone(5100,40);
void meow2() { // cat meow (emphasis on "ow")
  uint16_t i;
                            // "m" (short)
  playTone(5100,55);
                            // "eee" (long)
  playTone(394,170);
                            // wait a tiny bit
  delay(30);
                            // vary "ooo" down
  for(i=330; i<360; i+=2)
     playTone(i,10);
                            // "w" (short)
  playTone(5100,40);
void mew() { // cat mew
  uint16 t i;
                            // "m"
  playTone(5100,55);
                                      (short)
```

© Adafruit Industries Page 23 of 31

Now when you flick or shake the tilt ball switch, the circuit should chirp! If it doesn't, check your connections with a multimeter and be sure your software is configured properly for programming GEMMA. Mike Barela has written additional animal sounds (https://adafru.it/dc9), in case you want to meow or bark instead of chirp!

CircuitPython Code

GEMMA M0 boards can run CircuitPython — a different approach to programming compared to Arduino sketches. In fact, CircuitPython comes factory pre-loaded on GEMMA M0. If you've overwritten it with an Arduino sketch, or just want to learn the basics of setting up and using CircuitPython, this is explained in the Adafruit GEMMA M0 guide (https://adafru.it/z1B).

© Adafruit Industries Page 24 of 31

These directions are specific to the "M0" GEMMA board. The original GEMMA with an 8-bit AVR microcontroller doesn't run CircuitPython...for those boards, use the Arduino sketch on the "Arduino code" page of this guide.

Below is CircuitPython code that works similarly (though not exactly the same) as the Arduino sketch shown on a prior page. To use this, plug the GEMMA M0 into USB...it should show up on your computer as a small flash drive...then edit the file "code.py" with your text editor of choice. Select and copy the code below and paste it into that file, entirely replacing its contents (don't mix it in with lingering bits of old code). When you save the file, the code should start running almost immediately (if not, see notes at the bottom of this page).

If GEMMA M0 doesn't show up as a drive, follow the GEMMA M0 guide link above to prepare the board for CircuitPython.

Assemble Owl

Tape up the battery to protect it and protect the wire connections.

© Adafruit Industries Page 27 of 31

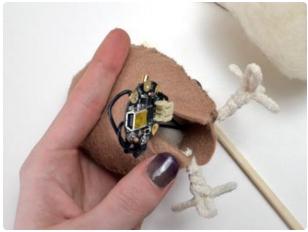

Start making the owl according to the paper instructions included in the box.

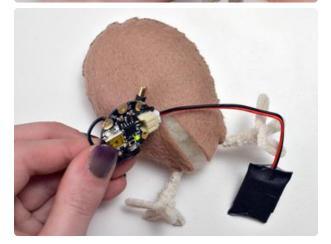

Cut a slit up the back body piece to make a path for the speaker wires.

Arrange your circuit as shown.

© Adafruit Industries Page 28 of 31

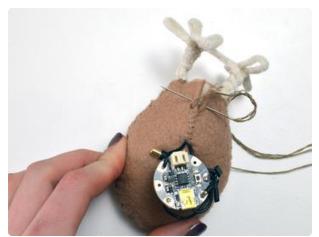

Begin stuffing the body, then insert the speaker just behind the front of the body.

Bend the wires so they route straight out the back of the owl body, at the top of the slit you made in the last step.

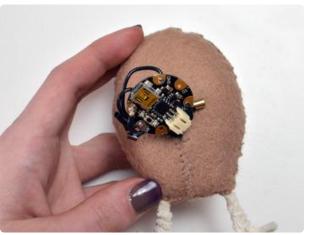

Continue and finish stuffing the owl. Plug in the battery to test out the loudness of your circuit. If it's not as loud as you like, make sure the speaker is flush up against the front of the body and not insulated by any stuffing.

Unplug the battery to finish constructing the owl.

© Adafruit Industries Page 29 of 31

Stitch up the slit and bottom of the owl and continue making the owl as per the paper instructions.

© Adafruit Industries Page 30 of 31
