## Datasheet

Gate Driver for 1.2 kV and 1.7 kV PrimePACK™ 3+ Power Modules  
Supporting 2-level and 3-level NPC-1 Applications

### Product Highlights

#### Highly Integrated, Compact Footprint

- Ready-to-use gate driver solution for PrimePACK™ 3+ IGBT power modules with 1200 V and 1700 V blocking voltage
- Dual channel gate driver
- Electrical primary-side interface with reinforced isolation
- Available for 2-level and 3-level NPC-1 applications
- ±30 A peak output gate current
- 2 W output power per channel at maximum ambient temperature
- -40 °C to +85 °C operating ambient temperature

#### Protection and Safety Features

- Reinforced insulation between primary and secondary side
- Undervoltage lock-out (UVLO) protection for primary-side (low voltage side) and secondary-side (high voltage side)
- Short-circuit protection
- Dynamic Advanced Active Clamping (DA<sup>2</sup>C)
- Applied double sided conformal coating

#### Full Safety and Regulatory Compliance

- 100% production partial discharge and HIPOT test according to
  - A version: EN 50178:1997
  - B version: IEC 62109:2010
- Clearance and creepage distances requirements between primary and secondary sides according to
  - A version: IEC 62497-1:2013 and EN 50178:1997
  - B version: IEC 62109-1:2010
- Clearance and creepage distances requirements between both secondary sides according to
  - A version: EN 50178:1997
  - B version: IEC 62109-1:2010

### Applications

- Wind and solar power
- Traction inverter
- Industrial drives
- Other industrial applications

### Description

The plug-and-play 2SP0430T gate driver family is optimized for operation of 1200 V and 1700 V PrimePACK™ 3+ IGBT power modules in 2-level and 3-level NPC-1 applications.

The gate driver features an electrical interface with 15 V logic and built-in DC/DC power supply.

Power Integrations' Dynamic Advanced Active Clamping allows an extended DC-link voltage range in IGBT off-state for up to 60 s in solar and regenerating applications (e.g. traction).

Figure 1. 2SP0430T Versions with Standard (A version, left) and Increased (B version, right) Isolation Test Voltage.

Notes:

## Interface Description

Figure 2. Interface.

### Connector X1

To external system controller (DIC-20 connector).

#### VDC (Pin 1, 3):

These pins are the primary-side 15 V supply voltage connection for the integrated DC/DC converter. It is mandatory to use the same supply for VDC and VCC.

#### VCC (Pin 5, 7):

These pins are the primary-side 15 V supply voltage connection for the primary-side electronic. It is mandatory to use the same supply for VDC and VCC.

#### SO2 (Pin 9):

This pin is the status output for channel 2 (high-side switch).

#### IN2 (Pin 11):

This pin is the command input for channel 2 (high-side switch).

#### SO1 (Pin 13):

This pin is the status output for channel 1 (low-side switch).

#### IN1 (Pin 15):

This pin is the command input for channel 1 (low-side switch).

#### NC (Pins 17, 19):

These pins are electrically not connected.

#### GND (Pin 2, 4, 6, 8, 10, 12, 14, 16, 18, 20):

These pins are the connection for the primary-side ground potential. All primary-side signals refer to these pins.

### Optical Indicator

#### P

White optical indicator for monitoring the voltage  $V_{VCC}$ . During the absence of  $V_{VCC}$  the indicator is OFF.

## 2SP0430T Functional Description

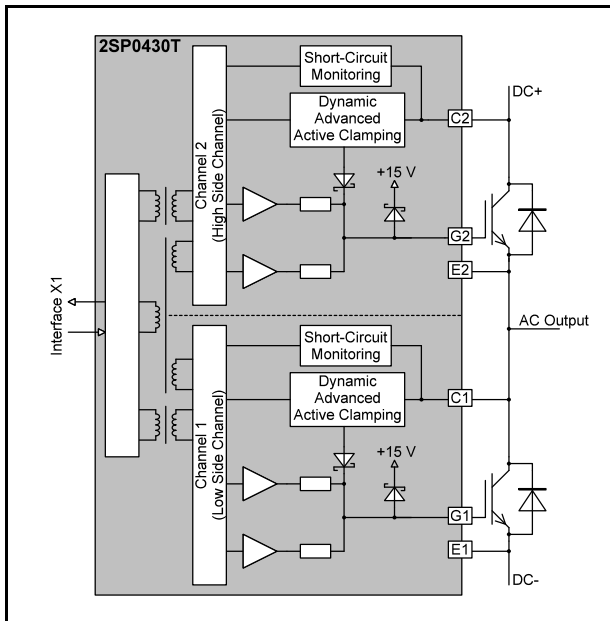

Figure 3. Functional Block Diagram.

The 2SP0430T is a dual channel plug-and-play gate driver for PrimePACK™ 3+ power modules. The gate driver is available in different variants, which all provide reinforced isolation for all primary-side signals:

- 2SP0430T2A0 for PrimePACK™ 3+ power modules. This variant features an isolation rating between primary-side and secondary-side of 5000  $V_{RMS}$ .
- 2SP0430T2B0 for PrimePACK™ 3+ power modules. This variant features an isolation rating between primary-side and secondary-side of 9100  $V_{RMS}$ .

As plug-and-play gate driver the 2SP0430T characteristics match the requirements of the individual power modules.

The operation of the channel 1 (low-side switch) and channel 2 (high-side switch) of the gate driver is independent from each other. Any dead time insertion, to avoid synchronous or overlapping switching of the driven power switches, has to be generated in the external system controller.

**⚠ Note:** Synchronous or overlapping switching of top and bottom switches within a half-bridge leg may damage or destroy the driven power switch(es) and in conjunction as secondary failure the attached gate driver.

### Power Supplies

The 2SP0430T provides two power supply inputs. For both a typical supply voltage level of 15 V is required. The first input VDC supplies the integrated DC/DC converter, which generates the isolated voltage for the secondary-side gate driver channels. The positive rail of the gate driver channels has the voltage level  $V_{VISOx}$  and the negative rail the voltage level  $V_{COMx}$ . Both are referenced to the emitter potential at terminal E1 or E2 of the driven power semiconductor.

The second input VCC supplies the primary-side electronic

of the gate driver. It is mandatory to provide the supply for VDC and VCC from the same source.

### Under Voltage Monitoring

The supply voltages are closely monitored. In case of an under voltage condition (UVLO) a failure signal will be provided on the status output of the gate driver. If the UVLO is present on the primary-side supply  $V_{VCC}$ , both status output signals will be set to GND and all gate driver channels will be turned-off synchronously. In case of an UVLO on the secondary-side, the status signal of the respective channel will be set to GND and the corresponding power semiconductor will be turned-off.

### Inputs (Primary-Side X1)

The input logic of IN1 and IN2 is designed to work with 15 V logic levels to provide sufficient signal/noise ratio. Both inputs have positive logic and are edge triggered.

Gate driver signals are transferred from the IN1 and IN2 pins to the corresponding gate with a propagation delay of  $t_{P(LH)}$  for the turn-on and  $t_{P(HL)}$  for the turn-off commands.

### Outputs (Primary-Side X1)

The gate driver provides a status feedback SOx at pins 9 and 13. The status feedback signal stays at  $V_{VCC}$  under no-fault condition. In case of a fault, e.g. detected short-circuit of the driven power module or an under voltage lock-out (UVLO) condition on the secondary-side, the status feedback is set to GND potential for a duration of  $t_{blk}$ . In case of a primary-side UVLO condition both status feedback signals remain at GND during the UVLO and are extended by  $t_{blk}$ . During this time no gate signals will be transmitted to the respective gate driver channel.

### Screw Terminals

The gate driver is mounted on top of the power module and fixed by screws. Details are given in the section Mounting Instruction.

### Gate Voltage

2SP0430T possesses a voltage regulator for the positive (turn-on) rail of the gate voltage. Internal current sources are regulating actively the positive gate-emitter voltage independently of actual load conditions within the maximum specified ratings. Therefore, the on-state gate-emitter voltage of the power semiconductor equals in steady state the positive supply voltage  $V_{VISO}$ .

The off-state gate-emitter voltage  $V_{GE(off)}$  equals in steady state the voltage  $V_{COM}$ . This voltage is load dependent. It has its lowest value under no load conditions and is increasing slightly (i.e. getting less negative) with increasing load.

In the event of an under voltage lock-out condition the gate driver changes the control of the positive rail towards control of the negative rail  $V_{COM}$ . By this potential parasitic turn-on events of the power semiconductor are avoided.

### Short-Circuit Protection

The gate driver uses the semiconductor desaturation effect to detect short-circuits. The desaturation is monitored by using a resistor sensing network. The collector-emitter voltage is checked after the response time  $t_{res}$  at turn-on to detect a short circuit. If the voltage is higher than the programmed threshold voltage  $V_{CE(stat)}$ , the driver detects a

short-circuit condition. The monitored semiconductor is switched off immediately and a fault signal is transmitted to the primary-side status output SOx (pin 9 and/or pin 13) after a delay  $t_{SOx}$ .

The fault feedback is automatically reset after the blocking time  $t_{blk}$ . The semiconductor is turned-on again as soon as the next positive edge is applied to the respective inputs IN1 or IN2 after the fault status has disappeared.

It should be noted that the response time  $t_{res}$  is dependent on the DC-link voltage. It remains constant over a wide range of the higher DC-link voltage range and increases at lower DC-link voltages.

Figure 4. Short-Circuit Turn-Off.

**!** Note: The desaturation function is for short-circuit detection only and cannot provide overcurrent protection. However, overcurrent detection has a lower time priority and can be easily provided by the application.

### Gate Clamping

In the event of a short-circuit condition the gate voltage is increased due to the high  $dv/dt$  between the collector and emitter terminals of the driven power semiconductor. This  $dv/dt$  is driving a current through the Miller-capacitance (capacitance between the gate and collector) and charges the gate capacitance, which eventually leads to a gate-emitter voltage larger than the nominal gate-emitter turn-on voltage. In consequence, the short-circuit current is increased due to the transconductance of the power semiconductor.

To ensure that the gate-emitter voltage stays close to the nominal turn-on voltage the gate driver features a gate-clamping circuitry. The gate clamping provides a voltage similar to  $V_{VISO}$  to the gate, i.e. 15 V. As the effective short-circuit current is a function of the gate-emitter voltage the short-circuit current is limited. This is shown in Figure 4 where the gate-emitter voltage and in consequence the short-circuit current is kept at a flat plateau. As a result the energy dissipated in the power semiconductor during the short-circuit event is reduced, leading to a junction temperature within the short-circuit safe operating area (SCSOA) limits and enables a safe turn-off of the device.

### Dynamic Advanced Active Clamping (DA<sup>2</sup>C)

Active clamping is a technique designed to partially turn on the IGBT in case the collector-emitter voltage exceeds a

predefined threshold. The IGBT is then kept in linear operation. Basic active clamping topologies implement a single feedback path from the IGBT's collector through transient voltage suppressor (TVS) diodes to the IGBT gate. The 2SP0430T gate driver contains Power Integrations' Dynamic Advanced Active Clamping (DA<sup>2</sup>C) based on this principle:

When active clamping is activated, the turn-off MOSFET of the gate driver is switched off in order to improve the effectiveness of the active clamping and to reduce the losses in the TVS diodes. This feature – called Advanced Active Clamping – is mainly integrated in the secondary-side ASIC of the gate driver.

Additional TVS diodes have been added in series to the TVS diodes required to withstand the maximum DC-link voltage under switching operation. These TVS diodes are short-circuited during the IGBT on state as well as for about 15...20µs after the turn-off command to guarantee efficient active clamping. After this delay, these additional TVS diodes are activated and allow the DC-link voltage to be increased to a higher value during the IGBT off-state. This feature – together with Advanced Active Clamping – is called Dynamic Advanced Active Clamping (DA<sup>2</sup>C). Note that the time during which the voltage can be applied above the value for switching operation should be limited to short periods (<60s).

Figure 5. Dynamic Advanced Active Clamping (DA<sup>2</sup>C).

### Optical Indicator

The gate driver as one optical indicator. The white LED (P in Figure 2) monitors the voltage  $V_{VCC}$ .

**Absolute Maximum Ratings – all 2SP0430T versions if not otherwise specified**

Parameters	Symbol	Conditions $T_A = -40\text{ °C to }85\text{ °C}$	Min	Max	Unit	
<b>Absolute Maximum Ratings<sup>1</sup></b>						
<b>Primary-side supply voltage</b>	$V_{VDC}$	VDC and VCC must be applied in parallel to GND	0	16	V	
	$V_{VCC}$		0	16		
<b>Primary-side supply current</b>	$I_{VDC}$	Average supply current at full load		480	mA	
	$I_{VCC}$	Average supply current at full load		45		
<b>Logic input voltage (command signal)<sup>2</sup></b>	$V_{INx}$	INx to GND, low-state	0	4	V	
		INx to GND, high-state	12.6	$V_{VCC} + 0.5$	V	
<b>Logic output voltage (status signal)</b>	$V_{SOx}$	SOx to GND	0	$V_{VCC} + 0.5$	V	
<b>Gate output power per channel</b>	$P_{gx}$			2	W	
<b>Test voltage primary-side to secondary-side</b>	$V_{iso,ps}$	A versions <sup>3</sup>	50 Hz, 60 s		5000	$V_{RMS}$
		B versions <sup>3</sup>			9100	$V_{RMS}$
<b>Test voltage secondary-side to secondary-side</b>	$V_{iso,ss}$	A versions <sup>3</sup>	50 Hz, 60 s		4000	$V_{RMS}$
		B versions <sup>3</sup>			6000	$V_{RMS}$
<b>Operating voltage primary-side to secondary-side</b>	$V_{op}$	A versions <sup>3</sup>	Transient only		1700	$V_{pk}$
			Permanently applied		1250	$V_{DC}$
		B versions <sup>3</sup>	Transient only		2050	$V_{pk}$
			Permanently applied		1500	$V_{DC}$
<b>DC-link voltage</b>	$V_{DC-Link}$	1200 V versions	Switching operation		850	$V_{pk}$
			Off-state, limited to 60 s		1100	$V_{DC}$
		1700 V versions	Switching operation		1250	$V_{pk}$
			Off-state, limited to 60 s		1500	$V_{DC}$
<b>Common-mode transient immunity</b>	$ dv/dt $			50	kV/ $\mu$ s	
<b>Storage temperature<sup>4</sup></b>	$T_{st}$		-40	50	°C	
<b>Operating ambient temperature</b>	$T_A$		-40	85	°C	
<b>Surface temperature<sup>5</sup></b>	T			125	°C	
<b>Relative humidity</b>	$H_r$	No condensation		93	%	
<b>Altitude of operation<sup>6</sup></b>	$A_{op}$			2000	m	

Notes:

-  Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device.
- INx signals must statically be within the given limits. The transition from low-state to high-state and vice-versa must happen within 1 $\mu$ s.
- Refer to section Part Ordering Information.
- The storage temperature inside the original package or in case the coating material of coated products may touch external parts must be limited to the given value. Otherwise, it is limited to 85°C.
- The component surface temperature, which may strongly vary depending on the actual operating conditions, must be limited to the given value for coated gate driver versions to ensure long-term reliability of the coating material.
- Operation above this level requires a voltage derating to ensure proper isolation coordination.

## Recommended Operating Conditions – all 2SP0430T versions

Parameter	Symbol	Conditions $T_A = -40\text{ °C to }85\text{ °C}$	Min	Typ	Max	Unit

## Mounting Instruction

### 2SP0430T

The gate driver is mounted on top of the target power module with six screws to the gate, emitter, and collector terminals (Figure 6). The mounting force is given with  $M_{M4}$ . The given value refers to the mechanical property of the gate driver only.  $M_{M4}$  must not exceed the values given in the respective datasheet of the target power module. Hence, actual mounting torque may be smaller than  $M_{M4}$ .

Figure 6. Screw Terminals.

**!** To maintain the electrical isolation distances, the screw header including any washer must not exceed the available metallic terminal pad of the gate driver. For the terminals G1, E1, C1, G2, E2, and C2 the corresponding distances are given with  $d_{M4}$ .

To avoid mechanical stress of the gate driver during and after the mounting process any bending or warping force imposed to the gate driver must not lead to a vaulting or twisting of the housing of more than 0.75 % per axis according to Figure 7:

- Axis 1 and 2: max. 0.9 mm bending
- Axis 3: max. 0.7 mm bending
- Axis 4 and 5: max. 1.2 mm bending

The 2SP0430T possesses two fixation points S1 and S2 (Figure 6) for stand-offs to mitigate any bending force during assembly and operation. The stand-off could be mounted on the heatsink or the frame of the inverter system. The maximum diameter of the screw header and washer for the stand-offs are limited by  $d_{M3}$ .

Figure 8. 2SP0430T Mounted on PrimePACK™ 3+ Power Module showing Relevant Distances to the Surrounding.

**!** Note: The stand-offs have to be made of insulating material to avoid any conducting path from the gate driver to the heatsink or inverter frame.

In Figure 8 the minimum required space in front of the power module for mounting the 2SP0430T is given with 88.8 mm. This distance includes also the space for connector X1 with mounted cable. Further dimensions are given in section Product Dimensions.

Figure 7. Gate Driver Bending Lines.

To ensure proper cooling by natural or forced convection minimum clearance of 50 mm of the gate driver top side is required as shown in Figure 8. This includes also that the AC and/or DC bus bars are not covering parts or the entire gate driver top side (red circled area in Figure 8).

### Cables

**!** The cable from gate driver connector X1 to the system level controller is not part of the 2SP0430T gate driver and has to be provided by the designer of the system. It is recommended to route the cable with minimum parasitic coupling from the controller to the gate driver. Parasitic coupling in particular to any potential of the secondary-side of the gate driver (i.e. high voltage side) and the AC and/or DC bus bar has to be avoided. Otherwise, increased common-mode currents may circulate, which may cause interferences with command, measurement and/or status feedback signals. Furthermore, usage of pair-wise twisted cables is recommended.

## Application Guidelines

The following guidelines are meant to optimize the overall system performance when using 2SP0430T gate drivers in various applications.

### Power Supply

The gate driver has to be supplied by a fixed voltage of typically 15V at VDC and VCC. It is mandatory that one supply is used for both terminals.

### DC-Link Design

The mechanical and electrical design of the DC-link of the target application determines during turn-off events of the driven power semiconductor the over voltages  $\Delta V_{CE}$  according to equation (1). Here,  $L_{\sigma}$  describes the overall DC-link stray inductance (i.e. sum stray inductance of DC-capacitors, DC-link bus bar and power module) and  $di_C/dt$  the collector current change.

$$\Delta V = L_{\sigma} \cdot \frac{di_C}{dt} \quad (1)$$

If the over voltage  $\Delta V_{CE}$  plus the applied DC-link voltage  $V_{DC}$  exceed the breakdown voltage of the driven power module (refer to the reverse bias safe operating area RBSOA), the power module may be damaged. In case of excessive turn-off over voltages, one or more of the following application parameters have to be decreased:

- DC-link voltage  $V_{DC}$
- Stray inductance  $L_{\sigma}$
- Collector current  $i_C$

Therefore, during the installation and testing of the target application the actual over voltages  $\Delta V_{CE}$  at different conditions have to be measured.

Note: 2SP0430T gate driver will actively limit any over voltage during turn-off events under normal and over current conditions to safe levels using the implemented Dynamic Advanced Active Clamping scheme. However, it is not recommended that the clamping feature is active during normal switching conditions. It may lead to an over load of the implemented clamping devices. Furthermore, it might lead to an under voltage lock-out (UVLO) condition on the secondary-side power supply of the gate driver.

### Paralleling of Power Modules

Paralleling of PrimePACK™ 3+ power modules with 2SP0430T gate driver is in principle possible if the following basic rules are obeyed to ensure minimum load current imbalances and general proper system operation.

The load current sharing between paralleled power modules depends on several factors:

- Deviation of the power modules parameters like IGBT saturation voltage  $V_{CEsat}$ , diode forward voltage  $V_F$ , rise and fall times  $t_r$  and  $t_f$ , turn-on and turn-off delay times  $t_{d(on)}$  and  $t_{d(off)}$ . They are influencing the current sharing in the conducting (static) and switching (dynamic) phase.
- Deviation in the cooling of the power modules. The before mentioned parameters are mostly temperature

dependent. Inhomogeneous cooling of paralleled power modules influences therefore the static and dynamic current sharing.

- Deviation of the gate loop impedance. It leads to static and dynamic current imbalances.
- Deviation of the apparent DC-link stray inductance and resistance per paralleled power module. It leads to static and dynamic current imbalances.

Power module parameter deviations can be addressed by screening of power modules as offered by some manufacturers. The deviation in cooling can be compensated to a fair degree by the inherent positive temperature coefficient of the power modules. In case one power module takes over more current than the other power modules, it will heat-up more than the others. As a result the saturation voltage is increased, which leads to a reduction of the current in the power module. The system is self-regulated to a certain extent.

Deviations of the gate loop impedances are minimized by design, process and assembly control of 2SP0430T. Part of the gate loop impedance is also the terminal screw connection of the gate driver towards the power module. Here the recommended (i.e. maximum) mounting torque must be obeyed to minimize its influence.

Deviation of the apparent DC-link stray inductance and resistance between paralleled power modules refers to the mechanical arrangement of the power modules and DC-link.

Depending on the actual application conditions it might be required to add inductors in the AC output phases of each paralleled power module to symmetrize load current imbalance.

Note: Do not operate paralleled power modules without connected gate driver. This may lead to half-bridge short-circuits within the power modules and will eventually destroy them.

### Multilevel Topologies

2SP0430T gate driver are designed for 2-level and 3-level topologies. For 3-level topologies:

- Cascaded multilevel topologies on system level like for instance Modular Multilevel Converter (MMC) operating with 2-level topologies within one cell are supported without any restriction (implying that required isolation requirements are fulfilled).
- For 3-level systems the turn-off sequence has to be obeyed by the system controller to avoid overvoltage events, which might lead to an RBSOA (reverse biased safe operating area) violation of the power module. However, 2SP0430T gate driver have Power Integrations' Dynamic Advanced Active Clamping (DA<sup>2</sup>C) implemented, which enables the gate driver to protect the power modules against over voltage conditions arising by wrong turn-off sequences. The suitability of DA<sup>2</sup>C has to be checked within the target application.

Note: During short-circuit and/or under voltage events, the gate driver will immediately switch-off the respective power module. No control on the turn-off

sequence is given. Therefore, the suitability of 2SP0430T has to be checked on application level for this kind of topology.

### **Conformal Coating**

The electronic components of the 2SP0430T gate driver are protected with a layer of acrylic conformal coating using ELPEGUARD SL 1307 FLZ/2 from Lackwerke Peters on both sides of the PCB. This coating layer increases the product reliability when exposed to contaminated environments. Nevertheless, standing water (e.g. condensate water) on top of the coating layer is not allowed as this water will diffuse over time through the layer. Eventually it will form a thin film of conducting nature between PCB surface and coating layer, which will cause leakage currents. Such currents may lead to a disturbance of the performance of the 2SP0430T gate driver.

## Transportation and Storage Conditions

For transportation and storage conditions refer to Power Integrations' Application Note AN-1501.

## RoHS Statement

On the basis of Annexes II and III of European Directive 2011/65/EC of 008 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment (RoHS), we hereby state that the products described in this datasheet do not contain lead (Pb), mercury (Hg), hexavalent chromium (Cr VI), cadmium (Cd), polibrometo of bipenyl (PBB) or polibrometo diphenyl ether (PBDE) in concentrations exceeding the restrictions set forth in Annex II of 2011/65/EC with due consideration of the applicable exemptions as listed in Annex III of 2011/65/EC.

Power Integrations reserves the right to make changes to its products at any time to improve reliability or manufacturability. Power Integrations does not assume any liability arising from the use of any device or circuit described herein. POWER INTEGRATIONS MAKES NO WARRANTY HEREIN AND SPECIFICALLY DISCLAIMS ALL WARRANTIES INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF THIRD PARTY RIGHTS.

The statements, technical information and recommendations contained herein are believed to be accurate as of the date hereof. All parameters, numbers, values and other technical data included in the technical information were calculated and determined to our best knowledge in accordance with the relevant technical norms (if any). They may base on assumptions or operational conditions that do not necessarily apply in general. We exclude any representation or warranty, express or implied, in relation to the accuracy or completeness of the statements, technical information and recommendations contained herein.

No responsibility is accepted for the accuracy or sufficiency of any of the statements, technical information, recommendations or opinions communicated and any liability for any direct, indirect or consequential loss or damage suffered by any person arising therefrom is expressly disclaimed.

**Patent Information**

The products and applications illustrated herein (including transformer construction and circuits external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations patents may be found at [www.power.com](http://www.power.com). Power Integrations grants its customers a license under certain patent rights as set forth at <http://www.power.com/ip.htm>.

 **Safety Notice**

The data contained in this datasheet is intended exclusively for technically trained staff. Handling all high-voltage equipment involves risk to life. Strict compliance with the respective safety regulations is mandatory.

Any handling of electronic devices is subject to general specifications for protecting electrostatic-sensitive devices according to international standard IEC 60747-1, Chapter IX or European standard EN 100015 (i.e. the workplace, tools, etc. must comply with these standards). Otherwise, this product may be damaged.

 **Life Support Policy**

POWER INTEGRATIONS PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF POWER INTEGRATIONS. As used herein:

1. A Life support device or system is one which, (i) is intended for surgical implant into the body, or (ii) supports or sustains life, and (iii) whose failure to perform, when properly used in accordance with instructions for use, can be reasonably expected to result in significant injury or death to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
