

## Description

The 5PB12xx is a high-performance TCXO/LVCMOS clock fanout buffer family with individual OE pin for each output. The CLKIN pin can accept either a square wave (LVCMOS) or clipped sine wave (such as TCXO clipped sine wave output) as input.

There are 3 different fan-out versions available: 1:3, 1:4 and 1:6.

The 5PB12xx has industry-leading low jitter and extremely low current consumption, making it ideal for smart mobile devices.

## Typical Applications

- Smart Mobile Handsets
- RF and baseband peripheral clock distribution
- Automotive

## Features

- Extremely low operating and standby current consumption
- Low RMS additive phase jitter
- Family supports 1.8V to 3.3V power supply voltage:
  - For 1.8V supply: 5PB1203, 5PB1204, 5PB1206
  - For 2.5V / 3.3V supply: 5PB1213, 5PB1214, 5PB1216
- Three, four, and six outputs with individual Output Enable pin
- One input
- OE\_OSC control pin to enable/disable reference TCXO/XO
- Small 10-pin, 16-pin and 20-pin packages available
- Industrial -40° to +105°C temperature range

## External Components

A minimum number of external components are required for proper operation. A 0.01µF bypass capacitor should be used on each VDD pin. Use a separate ground via to the board ground plane for the capacitor. Use a separate ground via for each GND pin. Do not share the ground via. Route power from the via to the VDD plane through the bypass capacitor and then to the VDD pin. A 33Ω series termination resistor should be used on each clock output pin.

To achieve the low output skew that the 5PB12xx is capable of, careful attention must be paid to board layout. Essentially, all four outputs must have identical terminations, identical loads and identical trace geometries. If they do not, the output skew will be degraded. For example, using a 30Ω series termination on one output (with 33Ω on the others) will cause at least 15ps of skew.

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 5PB12xx. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.
