

## Description

The 74LVC2G02 is a dual, two input NOR gate. Both gates have push-pull outputs designed for operation over a power supply range of 1.65V to 5.5V. The device is fully specified for partial power down applications using I<sub>OFF</sub>. The I<sub>OFF</sub> circuitry disables the output, preventing damaging current backflow when the device is powered down. Each gate performs the positive Boolean function:

$$Y = \overline{A + B} \text{ or } Y = \overline{A} \bullet \overline{B}$$
