DATASHEET

SIX CHANNEL HD AUDIO CODECS

DUAL CAPLESS HEADPHONE AMPLIFIERS

92HD66C

DESCRIPTION

The 92HD66C is a low power optimized, high fidelity, 6-channel audio codec compatible with Intel's High Definition (HD) Audio Interface.

The 92HD66C provides high quality, HD Audio capability to notebook and desktop PC applications.

FEATURES

- **6 Channels (2 stereo ADCs) with 24-bit resolution**
- **Full HDA015-B and EuP low power support**
  - Audio inactivity transitions codec from D0 to D3 low power mode
  - Resume from D3 to D0 with audio activity in < 10 msec
  - D3 to D0 transition with < -65dB pop/click
  - Port presence detect in D3 with or without bit clock
  - PC beep wake up in D3
  - Additional vendor specific modes for even lower power
- **Microsoft WLP premium logo compliant**
- **4 or 5 analog ports with port presence detect***
- **3 integrated headphone amplifiers**
- **2 Capless headphone amplifiers**
- **3 or 4 ports support adjustable microphone bias***
- **Dual SPDIF outputs for WLP compliant support of simultaneous HDMI and SPDIF output**
- **SPDIF Input**
- **Two digital microphone inputs (mono, stereo or quad)**
- **High performance analog mixer**
- **Support for 1.5V and 3.3V HDA signaling**
- **Integrated AVDD LDO for improved PSRR**
- **+5 V or +3.3V analog power supply**
- **Digital and Analog PC Beep to all outputs**
- **48-pin or 40-pin QFN RoHS packages**

SOFTWARE SUPPORT

- **Intuitive IDT HD Sound graphical user interface that allows configurability and preference settings**
- **12 band fully parametric equalizer**
  - Constant, system-level effects tuned to optimize a particular platform can be combined with user-mode "presets" tailored for specific acoustical environments and applications
  - System-level effects automatically disabled when external audio connections made
- **Dynamics Processing**
  - Enables improved voice articulation
  - Compressor/limiter allows higher average volume level without resonances or damage to speakers.
- **IDT Vista APO wrapper**
  - Enables multiple APOs to be used with the IDT Driver
- **Microphone Beam Forming, Acoustic Echo Cancellation, and Noise Suppression**
- **Dynamic Stream Switching**
  - Improved multi-streaming user experience with less support calls
- **Broad 3rd party branded software including Creative, Dolby, DTS, and SRS**

DEVICE OPTIONS

- **6 Channel, 48-pin QFN package**
- **6 Channel, 40-pin QFN package**
  - ***40-pin package removes**
    - Port E and related VREF_Out
    - Mono Out
    - GPIO 4

1. DESCRIPTION

1.1. Overview

The 92HD66C provide stereo 24- bit, full duplex resolution supporting sample rates up to 192kHz by the DAC and ADC. SPDIF outputs support sample rates of 192kHz, 96kHz, 88.2kHz, 48kHz, and 44.1kHz. SPDIF input supports 96KHz, 88.2KHz, 48KHz, and 44.1KHz sample rates. Additional sample rates are supported by the driver software.

The 92HD66C supports a wide range of desktop and laptop 6-channel configurations. The 2 independent SPDIF output interfaces provides connectivity to consumer electronic equipment or to a home entertainment system. Simultaneous HDMI and SPDIF output is possible. All inputs can be programmed with 0-30 dB gain in 10 dB steps allowing for line or microphone use of any input.

Port presence detect capabilities allow the CODEC to detect when audio devices are connected to the CODEC. The fully parametric IDT SoftEQ can be initiated upon headphone jack insertion and removal for protection of notebook speakers.

The 92HD66C operates with a 3.3V digital supply and a 5V analog supply. It allows for 1.5V and 3.3V HDA signaling; the correct signalling level is selected based on the power supply voltage on the DVDD-IO pin.

The 92HD66C is offered in a 48 or 40 pin QFN Environmental (ROHS) package.

1.2. Orderable Part Numbers

92HD66C1X5NDGXyyX	6ch, 40QFN, 1.5V HDA Signaling, 5V AVDD
92HD66C1X3NDGXyyX	6ch, 40QFN, 1.5V HDA Signaling, 3.3V AVDD
92HD66C2X5NDGXyyX	6ch, 40QFN, 3.3V HDA Signaling, 5V AVDD
92HD66C2X3NDGXyyX	6ch, 40QFN, 3.3V HDA Signaling, 3.3V AVDD
92HD66C3X5NLGXyyX	6ch, 48QFN, switchable 1.5V or 3.3V HDA Signaling, 5V AVDD

yy = silicon stepping/revision, contact sales for current data.
Add an “8” to the end for tape and reel delivery.

2. DETAILED DESCRIPTION

2.1. Port Functionality

Pins (40-pin)	Pins (48-pin)	Port	Input	Output	Head phone	Mic Bias (Vref pin)	Input boost amp
22/23/32/33	29/30/39/40	A	Yes	Yes	Yes	Yes[1]	Yes
24/25/35/36	31/32/42/43	B	Yes	Yes	Yes	Yes[1]	Yes
14/15	19/20	C	Yes	Yes		Yes	Yes
-	-	D					
-	15/16	E	Yes	Yes		Yes	Yes
12/13	17/18	F	Yes	Yes	Yes		Yes
40	48	SPDIF_OUT0	Yes[2]	Yes			Yes[3]
38	46	SPDIF_OUT1	Yes[2]	Yes			Yes[3]
37	45	SPDIF_IN	Yes				
3 (CLK=2)	4 (CLK=2)	DMIC0	Yes				Yes

Table 1. Port Functionality

1. Ports A and B provide internal microphone bias on the headphone out pins. No external VrefOut pin is needed.
2. DMIC1
3. Boost amp is only available for DMIC input and is not associated with the pin widget

2.2. Port Characteristics

Universal (Bi-directional) jacks are supported on ports A, B, C, E, and F. Ports A, B, and F are designed to drive 32 ohm (nominal) headphones or a 10K (nominal) load. Line Level outputs are intended to drive an external 10K load (nominal) and an on board shunt resistor of 20-47K (nominal). However, applications may support load impedances of 2.8K ohms and above when implementing ports capable of operating as microphone inputs or line outputs. Input ports are 75K (nominal) at the pin.

DAC full scale outputs and intended full scale input levels are greater than 1V rms at 5V (+5%/ -10%) to meet WLP requirements. Line output ports and Headphone output ports on the codec may be configured for +3dBV full scale output levels by using a vendor specific verb.

Output ports implement anti-pop circuits to prevent pops/clicks associated with turning power on/off or charging and discharging output coupling capacitors (except for cap-less headphone ports). Unused ports should be left unconnected. When updating existing designs to use the codec, ensure that there are no conflicts between the output ports on the codec and existing circuitry.

AFG Power State	Input Enable	Output Enable	Used as output for DAC/Mixer	Used as output for analog PC_Beep	Used as input for ADC, mixer	Port Behavior
D0-D2	1	1	Don't care	Don't care	Yes	Not allowed. Port is active as Input.
	1	1	Don't care	Don't care	No	Not allowed. Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.

Table 2. Analog Output Port Behavior

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

AFG Power State	Input Enable	Output Enable	Used as output for DAC/Mixer	Used as output for analog PC_Beep	Used as input for ADC, mixer	Port Behavior
	1	0	NA	NA	Yes	Active - Port enabled as input
	1	0	NA	NA	No	Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
	0	1	currently used by DAC, mixer, beep, or is traditional line or headphone output		NA	Active - Port enabled as output
	0	1	not currently used by DAC, mixer, beep, and is cap-less headphone output		NA	Inactive (Power Down)
	0	0	NA	NA		Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
D3	1	1	NA	NA	Don't care	Not allowed. Port is active as Input.
	1	0	NA	NA	Don't care	Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
	0	1	currently used by DAC, mixer, beep, or is traditional line or headphone output		Don't care	Low power state. If enabled, Beep will output from the port
	0	1	not currently used by DAC, mixer, beep, and is cap-less headphone output		Don't care	Inactive (Power Down)
	0	0	NA	NA	Don't care	Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
D3cold	-	-				Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
D4	-	-				Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
D5	-	-				Off - Charge on coupling caps (if used) will not be maintained.

Table 2. Analog Output Port Behavior

2.3. Vref_Out

Ports A, B, C, & E (48-pin package only) support Vref_Out pins for biasing electret cartridge microphones. Settings of 80% AVDD, 50% AVDD, GND, and Hi-Z are supported. Attempting to program a pin widget control with a reserved or unsupported value will cause the associated Vref_Out pin to assume a Hi-Z state and the pin widget control Vref_En field will return a value of '000' (Hi-Z) when read.

2.4. Jack Detect

Plugs inserted to a jack are detected using SENSE inputs as described in the tables below. Per ECR15-B, the detection circuit operates when the CODEC is in D0 - D3 and can also operate if both the CODEC and Controller are in D3 (no bus clock.) Jack detection requires that all supplies (analog and digital) are active and stable. When AVDD is not present, the value reported in the pin widget is invalid.

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

When the HD Audio bus is in a low power state (reset asserted and clock stopped) the CODEC will generate a Power State Change Request when a change in port connectivity is sensed and then generate an unsolicited response after the HD Audio link has been brought out of a low power state and the device has been enumerated. Per ECR015-B, this will take less than 10mS.

The following table summarizes the proper resistor tolerances for different analog supply voltages.

.

AVdd Nominal Voltage (+/- 5%)	Resistor Tolerance Pull-Up	Resistor Tolerance SENSE_A/B
4.75V or 5.0V	1%	1%

Table 3. Resistor Tolerance

Resistor	SENSE_A	SENSE_B
39.2K	PORT A	PORT E
20.0K	PORT B	Mono
10.0K	PORT C	SPDIF0/DMIC1
5.11K	PORT F	SPDIF1/DMIC1
2.49K	Pull-up to Avreg (X5) Pull-up to AVDD (X3)	Pull-up to Avreg (X5) Pull-up to AVDD (X3)

Table 4. 48 pin Jack Detect

.

Resistor	SENSE_A
39.2K	PORT A
20.0K	PORT B
10.0K	PORT C
5.11K	PORT F
2.49K	Pull-up to Avreg (X5) Pull-up to AVDD (X3)

Table 5. 40 pin Jack Detect

See reference design for more information on Jack Detect implementation.

2.5. SPDIF Output

Both SPDIF Outputs can operate at 44.1kHz, 48kHz, 88.2kHz, 96kHz and 192KHz as defined in the Intel High Definition Audio Specification with resolutions up to 24 bits. This insures compatibility with all consumer audio gear and allows for convenient integration into home theater systems and media center PCs.

Note: Peak to peak jitter is currently limited to less than 4.5nS (half of the internal master clock cycle) which does not meet the IEC-60958-3 0.05UI requirement at 192KHz.

The two SPDIF output converters can not be aligned in phase with the DACs. Even when attached to the same stream, the two SPDIF output converters may be misaligned with respect to their frame boundaries.

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

Per HDA015-B, the SPDIF outputs support the ability to provide clocking information even when no stream is selected for the converter, or when in a low power state. Also, as stated in the DCN, the SPDIF output ports support port presence detect.

SPDIF Outputs are outlined in tables below. .

AFG Power State	RESET#	GPIO0 Enable	Input Enable	Output Enable	Keep Alive En	Converter Dig En	Stream ID	Pin Mode	Pin Behavior
D0-D4	Asserted (Low)	-	-	-	-	-	-		Hi-Z immediately after power on, otherwise the previous state is retained.
D0-D4	De-Asserted (High)	0	0	0	-	-	-		Hi-Z
D0-D4	De-Asserted (High)	1	-	-	-	-	-	GPIO	Active - Pin reflects GPIO0 configuration (internal pull-down enabled)
D0-D4	De-Asserted (High)	0	1	0	-	-	-	SPDIF IN or DMIC IN	Pin functions as SPDIF input or DMIC input
D0	De-Asserted (High)	0	0	1	0	0	-	SPDIF OUT	Active - Pin drives 0
						1	0		Active - Pin drives SPDIF-format, but data is zeroes
							1-15		Active - Pin drives SPDIFOut1 data
					1	0	-		Active - Pin drives SPDIF-format, but data is zeroes
						1	0		Active - Pin drives SPDIF-format, but data is zeroes
							1-15		Active - Pin drives SPDIFOut1 data
D1-D2	De-Asserted (High)	0	0	1	0	0	-		Active - Pin drives 0
					0	1	-		Active - Pin drives 0
					1	0	-		Active - Pin drives SPDIF-format, but data is zeroes
					1	1	-		Active - Pin drives SPDIF-format, but data is zeroes
D3	De-Asserted (High)	0	0	1	0	0	-		Hi-Z
					0	1	-		Hi-Z
					1	0	-		Active - Pin drives SPDIF-format, but data is zeroes
					1	1	-		Active - Pin drives SPDIF-format, but data is zeroes
D3cold	De-Asserted (High)	0	0	1	-	-	-		Hi-Z
D4	De-Asserted (High)	0	0	1	-	-	-		Hi-Z
D5	-	-	-	-	-	-	-		Hi-Z

Table 6. SPDIF OUT 0 or 1 Behavior

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

2.6. SPDIF Input

SPDIF IN can operate at 44.1 KHz, 48 KHz, or 96 KHz, and implements internal Jack Sensing (Port presence Detect).

A sophisticated digital PLL allows automatic rate detection and accurate data recovery. The ability to directly accept consumer SPDIF voltage levels eliminates the need for costly external receiver ICs.

Status flags from the input stream are updated only after the entire valid block has been received (or at least when all bits of a particular status flag have been received) to ensure that software does not read an invalid mixture of old and new data.

In general, the SPDIF input block does not alter the data received. However, it is sometimes necessary to alter the data when the converter widget settings do not match the stream format. The following table outlines a few cases and the expected behavior.

Port presence detect for SPDIF_IN operates differently from other ports. Once the PLL has locked and valid framing (no errors) has been detected, then the port presence detect bit is set. In D3, and D3 without a clock, it is not possible to check for proper framing. Monitoring of activity (rising and falling edges) is sufficient to verify a change in connectivity in D3. If no clock is present, then the internal oscillator is used until a clock is restored. When the HD Audio bus is in a low power state (reset asserted and clock stopped) the CODEC will generate a Power State Change Request when a change in SPDIF_IN port connectivity is sensed and then generate an unsolicited response after the HD Audio link has been brought out of a low power state and the device has been enumerated. Per HDA015-B, this will take less than 10mS.

Conflict	Behavior	Resolution
Converter widget rate does not equal the stream rate	Although the SPDIF input block is designed to handle inputs slightly above or below the programmed rate, samples may be lost if the input rate is much higher than the rate programmed into the converter widget.	Program the converter widget with the same rate as indicated by the input stream.
Converter widget programmed for a word length less than the word length provided by the input stream	If the input stream indicates non PCM data, the data will be truncated to the requested word length. If LPCM data is indicated in the input stream, the CODEC will round the received data to the requested length.[1]	Program the converter widget with the word length indicated in the input stream.
Converter widget programmed with a word length greater than the word length provided by the input stream.	Regardless of content, 24 bits per channel of data will be transferred from the SPDIF input stream to the HD Audio bus interface. Truncation or rounding to the requested word length will be handled as described as above. Any non-zero data in the incoming stream will cause problems.	Program the converter widget with the word length indicated in the input stream. Although not recommended, application or driver software may program the converter widget with a word length of 24 bits, truncate the input to the word length indicated by the input stream, then right extend the data using 0s to the desired word length.

Table 7. SPDIF Behavior

1. Rounding may be disabled by setting the disable bit (AFG vendor specific verb -see widget list) or setting the SPDIF_IN converter widget Frmt StrmType field to 1 (non-PCM)

2.7. Mono Output

The Mono Out port source selection, power state, and mute characteristics are all independently controlled by the mono output port controls. **The mono output pin is not available on the 40-pin package options.**

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

The following sources are available for the Mono Out pin:

- DAC0 Output: When selected (by using the port connection list), the DAC0 left and right outputs are summed together.
- DAC1 Output: When selected (by using the port connection list), the DAC1 left and right outputs are summed together.
- DAC2 Output: When selected (by using the port connection list), the DAC2 left and right outputs are summed together.
- Mixer Output: When selected (by using the port connection list), the mixer left and right outputs are summed together.

The stereo inputs are scaled by -6dB and then summed to provide an output that is the average of the two inputs. The full scale output at mono out is designed to be about 0dBV. Like the stereo line and headphone outputs, it is not possible to adjust to a +3dBV output level using a vendor defined verb.

2.8. Analog Mixer

The mixer supports independent gain (-34.5 to +12dB in 1.5dB steps) on each input as well as independent mutes on each input. The following inputs are available: The output of the mixer may be sent to the ADC where the ADC record gain can adjust the volume. If the output of the mixer is sent to an analog port, then a separate volume control is provided to adjust the output volume. This mixer output volume control supports a gain range of -46.5dB to 0dB in 1.5dB steps. (Selecting -46.5dB will automatically mute the output.)

- Port A
- Port B
- Port C
- Port E (not available on 40-pin option)
- Port F
- DAC0
- DAC1
- DAC2

2.9. ADC Multiplexers

The codec implements 2 ADC input multiplexers. These multiplexers incorporate the ADC record gain function (-16 to +30dB gain in 1dB steps) as an output amp and allow a preselection of one of these possible inputs:

- Port A
- Port B
- Port C
- Port E (not available on 40-pin option)
- Port F
- Mixer Output
- DMIC 0
- DMIC 1

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

2.9. Power Management

The HD Audio specification defines power states, power state widgets, and power state verbs. Power management is implemented at several levels. The Audio Function Group (AFG) , all converter widgets, and all pin complexes support the power state verb F05/705. Converter widgets are active in D0 and inactive in D1-D3.

The following table describes what functionality is active in each power state.

Function	D0	D1[1]	D2	D3	D3cold	Vendor Specific D4[2]	Vendor SpecificD5[2]
SPDIF Outputs	On	On	On (idle)	On (idle)[6]	Off	Off	Off
SPDIF Input	On	Off	Off	Off	Off	Off	Off
Digital Microphone inputs	On	Off	Off	Off	Off	Off	Off
DAC	On	Off	Off	Off	Off	Off	Off
D2S	On	Off	Off	Off	Off	Off	Off
ADC	On	Off	Off	Off	Off	Off	Off
ADC Volume Control	On	Off	Off	Off	Off	Off	Off
Ref ADC	On	Off	Off	Off	Off	Off	Off
Analog Clocks	On	Off	Off	Off	Off	Off	Off
GPIO pins	On	On	On	On[6]	On	On	Off
VrefOut Pins	On	On	Off	Off	Off	Off	Off
Input Boost	On	On	Off	Off	Off	Off	Off
Analog mixer	On	On	Off	Off	Off	Off	Off
Mixer Volumes	On	On	Off	Off	Off	Off	Off
Analog PC_Beep	On	On	On	On	Off	Off	Off
Digital PC_Beep	On	On	On	On[6]	Off	Off	Off
Lo/HP Amps	On	On	On	Low Drive[3]	Low Drive[3]	Low Drive[3]	Off
VAG amp	On	On	On	Low Drive[4]	Low Drive	Low Drive	Off
Port Sense	On	On	On	On[5]	Off	Off	Off
Reference Bias generator	On	On	On	On	On	On	Off
Reference Bandgap core	On	On	On	On	On	On	Off
HD Audio-Link	On	On	On	On[6]	Limited[7]	Off	Off
PLL	On	On	On	Off[8]	Off[9]	Off	Off

Table 8. Power Management

1. No DAC or ADC streams are active. Analog mixing and loop thru are supported.
2. D4 and D5 power states are entered only when D3cold is requested. D4 and D5 may be viewed as D3cold behavioral options.
3. VAG is kept active when ports are disabled or in D3/D3cold/D4. PC_Beep is supported in D3 but may be attenuated and distorted depending on load impedance.
4. VAG is always ramped up and down gradually, except in the case of a sudden power removal. VAG is active in D2/D3 but in a low power state.
5. Both AVDD and DVDD must be available for Port Sense to operate.
6. Not active if BITCLK is not running (Controller in D3), but can signal power state change request (PME)
7. Only double function group reset verbs and link reset supported per ECR15b

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

8. PLL remains on if SPDIF_Out Keep Alive is enabled. PLL disabled only after DAC fading is complete and SDM has settled.
9. PLL disabled only after DAC fading is complete and SDM has settled.

The D3-default state is available for HD Audio compliance. The programmable values, exposed via vendor-specific settings, are under IDT Device Driver control for further power reduction. The analog mixer, line and headphone amps, port presence detect, and internal references may be disabled using vendor specific verbs. Use of these vendor specific verbs will cause pops.

The default power state for the Audio Function Group after reset is D3.

2.10. AFG D0

The AFG D0 state is the active state for the device. All functions are active if their power state (if they support power management at their node level) has been set to D0.

2.11. AFG D1

D1 is a lower power mode where all converter widgets are disabled. Analog mixer and port functions are active. The part will resume from theD1 to theD0 state within 1 mS.

2.12. AFG D2

The D2 state further reduces power by disabling the mixer and port functions. The port amplifiers and internal references remain active to keep port coupling caps charged and the system ready for a quick resume to either the D1 or D0 state. The part will resume from the D2 state to the D0 state within 2mS.

2.13. AFG D3

The D3-default state is available for HD Audio compliance. All converters are shut down. Port amplifiers and references are active but in a low power state to prevent pops. Resume times may be longer than those from D2, but still less than 10mS to meet Intel low power goals. The default power state for the Audio Function Group after power is applied is D3.

While in AFG D3, the HD Audio controller may be in a D0 state (HD Audio bus active) or in a D3 state (HD Audio bus held in reset with no Bit_Clk, SData_Out, or Sync activity.) The expected behavior is as follows (see the HDA015-B section for more information):

Function	HDA Bus active	HDA Bus stopped
Port Presence Detect state change	Unsolicited Response	Wake Event followed by an unsolicited response
GPIO state change	Unsolicited Response	Wake Event followed by an unsolicited response

2.13.1. AFG D3cold

The D3cold power state is the lowest power state available that does not use vendor specific verbs. While in D3cold, the CODEC will still respond to bus requests to revert to a higher power state (double AFG reset, link reset). However, audio processing, port presence detect, and other functions are disabled. Per the HD Audio bus HDA015-B, the D3cold state is intended to be used just prior to removing power to the CODEC. Typically, power will be removed within 200mS. However, the codec may exit from the D3cold state by generating 2, back-to-back, AFG reset events. Resume time from D3cold is less than 200mS.

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

2.14. Vendor Specific Function Group Power States D4/D5

The codec introduces vendor specific power states. A vendor defined verb is added to the Audio Function Group that combines multiple vendor specific power control bits into logical power states for use by the audio driver. The 2 states defined offer lower power than the 5 existing states defined in the HD Audio specification and HDA015-B. The Vendor Specific D4 state provides lower digital power consumption relative to D3cold by disabling HD Audio link responses. Vendor specific D5 further reduces power consumption on the digital supply by turning off GPIO drivers, and reduces analog power consumption by turning off all analog circuitry except for reset circuits.

States D4/D5 are not entered until D3cold has been requested so are actually D3cold options rather than true, independent, power states. Software can pre-program the D4 or D5 state as a re-definition of how the part will behave when the D3cold power state is requested or software may enter D3cold, then set the D4 or D5 before performing the power state get command. The preferred method is to request D3cold, then select D4 or D5 as desired.This will reduce the severity of pops encountered when entering D4 or D5.

Both power states require a link reset or removal of DVDD to exit.

The CODEC may pop when using these verbs and transition times to an active state (D1 or D0 for example) may take several seconds.

2.15. Vendor Specific Function Group Power State “D5 Kill”

Vendor specific “D5 Kill” places the device in a low power, non responsive, state that is intended to disable the CODEC when, for security reasons, it is desired that no audio playback or recording take place.

State “D5 Kill” is not entered until D3cold has been requested. Software pre-programs both the D4 and D5 state request bits (D4 and D5 = 1) then request D3cold. After responding to the Function Group Power State Get verb (needed to enter D3cold), the CODEC will no longer respond to any link activity. The only way to exit this state is to remove power (Power on reset will set the power state to D3.)

“D5 Kill” is identical to vendor specific D5 with the exception that the CODEC will only exit this state when power is removed.

2.16. Low-voltage HDA Signaling

The codec is compatible with either 1.5V or 3.3V HDA bus signaling; in the 48-QFN package the voltage selection is done dynamically based on the input voltage of DVDD_IO.

DVDD_IO is currently not a logic configuration pin, but rather provides the digital power supply to be used for the HDA bus signals.

When in 1.5V mode, the codec can correctly decode BITCLK, SYNC, RESET# and SDO as they operate at 1.5V; additionally it will drive SDI and SDO at 1.5V. None of the GPIOs are affected, as they always function at their nominal voltage (DVDD or AVDD).

2.17. Multi-channel capture

The capability to assign multiple ADC Converters to the same stream is supported to meet the microphone array requirements of Vista and future operating systems. Single converter streams are

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

still supported this is done by assigning unique non zero Stream IDs to each converter. All capture devices (ADCs 0 and 1) may be used to create a multi-channel input stream. There are no restrictions regarding digital microphones.

The ADC Converters can be associated with a single stream as long the sample rate and the bits per sample are the same. The assignment of converter to channel is done using the “CnvtrID” widget and is restricted to even values. The ADC converters will always put out a stereo sample and therefore require 2 channels per converter.

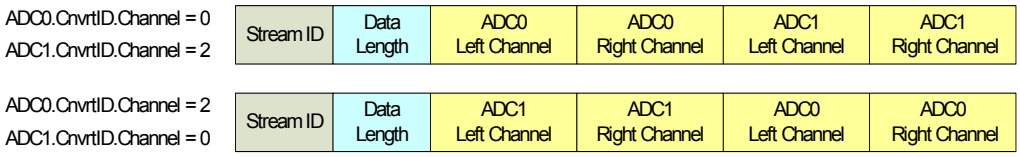
The stream will not be generated unless all entries for the targeted converters are set identically, and the total number of assigned converter channels matches the value in the NmbrChan field. These are listed the “Multi-Converter Stream Critical Entries.” table.

An example of a 4 Channel Steam with ADC0 supplying channels 0&1 and ADC1 supplying channels 2 & 3 is shown below. A 4 Channel stream can be created by assigning the same non-zero stream id “Strm= N” to both ADC0 and ADC1. The sample rates must be set the same and the number of channels must be set to 4 channels “NmbrChan = 0011”.

ADC1 CnvtrID	**(NID = 0x08)**	
	[3:0]	Ch = 2
ADC0 CnvtrID	**(NID = 0x07)**	
	[3:0]	Ch=0

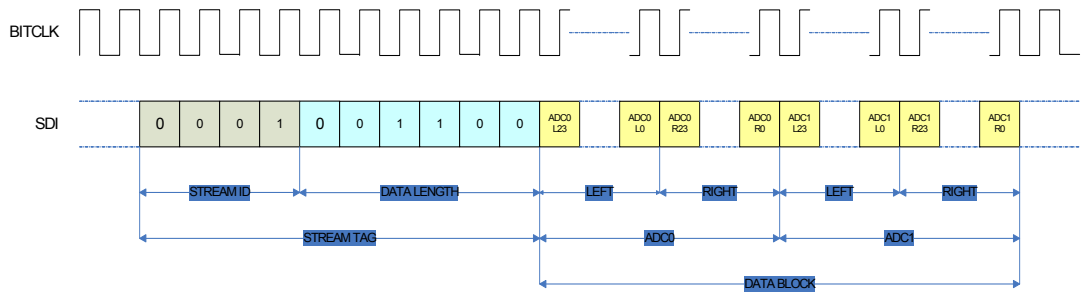
Table 9. Example channel mapping

Figure 1. Multi-channel capture



The following figure describes the bus waveform for a 24-bit, 48KHz capture stream with ID set to 1.

Figure 2. Multi-channel timing diagram



©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

ADC[1:0] Cnvtr	Bit Number	Sub Field Name	Description
	[15]	StrmType	Stream Type (TYPE): 0: PCM 1: Non-PCM (not supported)
	[14]	FrmtSmplRate	Sample Base Rate 0= 48kHz 1=44.1KHz
	[13:11]	SmplRateMultp	Sample Base Rate Multiple 000=48kHz/44.1kHz or less 001= x2 010= x3 (not supported) 011= x4 192kHz only, 176.4 not supported 100-111= Reserved
	[10:8]	SmplRateDiv	Sample Base Rate Divisor 000= Divide by 1 001= Divide by 2 (not supported) 010= Divide by 3 (not supported) 011= Divide by 4 (not supported) 100= Divide by 5 (not supported) 101= Divide by 6 (not supported) 110= Divide by 7 (not supported) 111= Divide by 8 (not supported)
	[6:4]	BitsPerSmpl	Bits per Sample 000= 8 bits (not supported) 001= 16 bits 010= 20 bits 011= 24 bits 100-111= Reserved
	[3:0]	NmbrChan	Number of Channels Number of channels for this stream in each “sample block” of the “packets” in each “frame” on the link. 0000=1 channel (not supported) 0001 = 2 channels … 1111= 16 channels.
	[7:4]	Strm	Software-programmable integer representing link stream ID used by the converter widget. By convention stream 0 is reserved as unused.
	[3:0]	Ch	Integer representing lowest channel used by converter. 0 and 2 are valid Entries If assigned to the same stream, one ADC must be assigned a value of 0 and the other ADC assigned a value of 2.

Table 10: Multi-channel

2.18. EAPD

The EAPD pin (pin 47) is a dedicated, bi-directional control pin. Although named External Amplifier Power Down (EAPD) by the HD Audio specification, this pin operates as an external amplifier power up signal. The EAPD value is reflected on the EAPD pin; a 1 causes the external amplifier to power up (equivalent to D0), and a 0 causes it to power down (equivalent to D3.) When the EAPD value =

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

1, the EAPD pin must be placed in a state appropriate to the current power state of the associated Pin Widget even though the EAPD value (in the register) may remain 1. The pin defaults to an open-drain configuration (an external pull-up is recommended.)

Per the HD Audio specification and HDA015-B, multiple ports may control EAPD. The EAPD pin assumes the highest power state of all the EAPD bits in all of the pin complexes. The default value of EAPD is 1 (powered on), but the FG power state will override and the pin will be low.

Vendor specific verbs are available to configure this pin. These verbs retain their values across link and single function group resets but are set to their default values by power on reset:

MODE1	MODE0	EAPD Pin Function	Description
0	0	Open Drain I/O	Value at pin is wired-AND of EAPD bit and external signal.(default)
0	1	CMOS Output	Value of EAPD bit in pin widget is forced at pin
1	0	CMOS Input	External signal controls internal amps. EAPD bit in pin widget ignored
1	1	CMOS Input	External signal controls internal amps. EAPD bit in pin widget ignored

Table 11. EAPD Pin Mode Select

Control Flag	Description
EAPD PIN MODE 1:0	Defines if EAPD pin is used as input, output, or bi-directional port (Open Drain)
HP SD	0 = Amp controlled by EAPD pin only (default) / 1 = Amp controlled by power state (pin and FG) only
HP SD MODE	0 = Amp will mute when disabled (default) / 1 = Amp will shut down (enter a low power state) when disabled
HP SD INV	0 = AMP will power down (or mute) when EAPD pin is low (default) / 1 = Amp will power down (or mute) when EAPD pin is high.

Table 12. Control bit descriptions for BTL amplifier and Headphone amplifier enable configurations

HP SD	HP SD MODE	HP SD INV	EAPD Pin State	Headphone Amp State
0	0	0	0	Amplifier is mute (default[1])
0	0	0	1	Amplifier is active
0	0	1	0	Amplifier is active
0	0	1	1	Amplifier is mute
0	1	0	0	Amplifier is in a low power state
0	1	0	1	Amplifier is active
0	1	1	0	Amplifier is active
0	1	1	1	Amplifier is in a low power state
1	0	NA	NA	Amplifier follows pin/function group power state and will mute when disabled
1	1	NA	NA	Amplifier follows pin/function group power state and will enter a low power state when disabled

Table 13. BTL Amp Enable Configuration

1. EAPD bit is set to one by default but the EAPD state is 0 after power-on reset because the function group is not in D0. The state after a single or double function group reset will be compliant with HDA015-B.

Each Headphone port has its own configuration bits for SD, SD MODE, and SD INV.

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

Analog BEEP enabled	EAPD Pin value[1]	Description
0	Forced to low when in D2 or D3	Follows description in HD Audio spec. External amplifier is shut down when pin or function group power state is D2 or D3 independent of value in EAPD bit.
1	Forced low in D2 or D3 unless port is enabled as output	Power state is ignored if port is enabled as output and port EAPD=1 to allow PC_Beep support in D2 and D3

Table 14. EAPD Analog PC_Beep behavior

1. When pin is enabled as Open Drain or CMOS output.

AFG Power State	RESET#	Analog PC_BEEP	Port Power State	Pin Behavior
D0-D3	Asserted (Low)	Enabled[1]	-	Active high immediately after power on, otherwise the previous state is retained across FG and link reset events
D0-D3	Asserted (Low)	Disabled	-	The previous state is retained across FG and link reset events
D0	De-Asserted (High)	-	-	Active - Pin reflects EAPD bit unless held low by external source.
D1	De-Asserted (High)	-	D0-D1	Active - Pin reflects EAPD bit unless held low by external source.
D2	De-Asserted (High)	Disabled	D0-D2	Pin forced low to disable external amp
D2	De-Asserted (High)	Enabled	D0-D2	Active - EAPD Pin high if any port EAPD bit =1 and that port also enabled as output.
D3	De-Asserted (High)	Disabled	D0-D3	Pin forced low to disable external amp
D3	De-Asserted (High)	Enabled	D0-D3	Active - EAPD Pin high if any port EAPD bit=1 and that port also enabled as output.
D3cold	De-Asserted (High)	-	-	Pin forced low to disable external amp
D4	De-Asserted (High)	-	-	Pin forced low to disable external amp
D5	De-Asserted (High)	-	-	Pin Hi-Z (off)

Table 15. EAPD Behavior

1. PC_Beep is automatically routed to ports A, B, D, and F after power-on reset while link reset is active and EAPD will be high to enable an external amplifier. This may be disabled using a vendor specific verb. If the automatic beep path is disabled, beep will still be supported with EAPD active in link reset if Analog Beep is manually enabled and at least one port is configured as an output before entering link reset. If the automatic Beep routing is disabled and Analog Beep has not been manually configured before entering link reset, then the EAPD pin will retain its current state.

HP AUDIO CONTROL BLOCK DIAGRAM

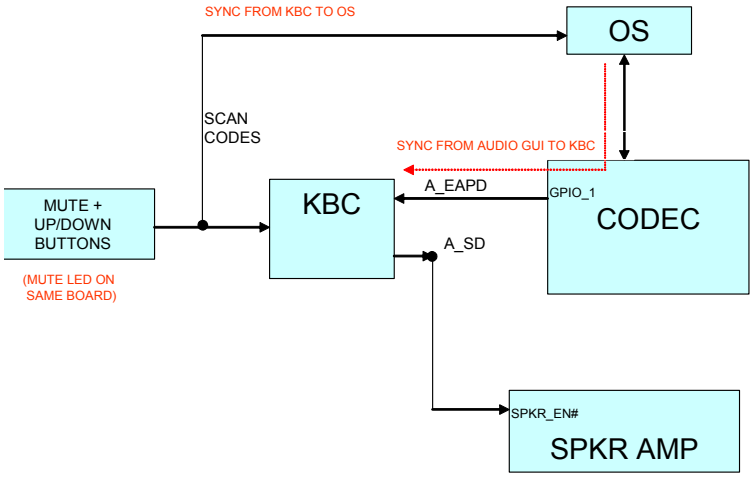

Figure 3. EAPD System level Example

2.19. Digital Microphone Support

The digital microphone interface permits connection of a digital microphone(s) to the CODEC via the DMIC0, DMIC1, and DMIC_CLK 3-pin interface. The DMIC0 and DMIC1 signals are inputs that carry individual channels of digital microphone data to the ADC. In the event that a single microphone is used, the data is ported to both ADC channels. This mode is selected using a vendor specific verb and the left time slot is copied to the ADC left and right inputs.

The DMIC_CLK output is controllable from 4.704Mhz, 3.528Mhz, 2.352Mhz, 1.176Mhz and is synchronous to the internal master clock. The default frequency is 2.352Mhz.

The two DMIC data inputs are reported as two stereo input pin widgets that incorporate a boost amplifier. The pin widgets are shown connected to the ADCs through the same multiplexors as the analog ports. Although the internal implementation is different between the analog ports and the digital microphones, the functionality is the same. In most cases, the default values for the DMIC clock rate and data sample phase will be appropriate and an audio driver will be able to configure and use the digital microphones exactly like an analog microphone.

To conserve power, the analog portion of the ADC will be turned off if the D-mic input is selected. When switching from the digital microphone to an analog input to the ADC, the analog portion of the ADC will be brought back to a full power state and allowed to stabilize before switching from the digital microphone to the analog input. This should take less than 10mS.

The DMIC capable pin widgets (NID 1Fh and NID 20h) support port presence detect using SENSE-B input on 2/3 DAC parts in a 48-pin package but not in a 40-pin package. However, the DMIC0 pin widget (NID 11h) does not support presence detect.

Digital Mics	Data Sample	ADC Conn.	Notes
0	N/A	N/A	No Digital Microphones
1	Single Edge	0, or 1	Available on either DMIC_0 or DMIC_1 When using a microphone that supports multiplexed operation (2-mics can share a common data line), configure the microphone for “Left” and select mono operation using the vendor specific verb. “Left” D-mic data is used for ADC left and right channels.
2	Double Edge on either DMIC_0 or 1	0, or 1	Available on either DMIC_0 or DMIC_1, External logic required to support sampling on a single Digital Mic pin channel on rising edge and second Digital Mic right channel on falling edge of DMIC_CLK for those digital microphones that don’t support alternative clock edge (multiplexed output) capability.
3	Double Edge on one DMIC pin and Single Edge on the second DMIC pin.	0, or 1	Requires both DMIC_0 and DMIC_1, External logic required to support sampling on a single Digital Mic pin channel on rising edge and second Digital Mic right channel on falling edge of DMIC_CLK for those digital microphones that don’t support alternative clock edge (multiplexed output) capability. Two ADC units are required to support this configuration
4	Double Edge	0, or 1	Connected to DMIC_0 and DMIC_1, External logic required to support sampling on a single Digital Mic pin channel on rising edge and second Digital Mic right channel on falling edge of DMIC_CLK for those digital microphones that don’t support alternative clock edge capability. Two ADC units are required to support this configuration

Table 16. Valid Digital Mic Configurations

Power State	DMIC Widget Enabled?	DMIC_CLK Output	DMIC_0,1	Notes
D0	Yes	Clock Capable	Input Capable	DMIC_CLK Output is Enabled when either DMIC_0 or DMIC_1 Input Widget is Enabled. Otherwise, the DMIC_CLK remains Low
D1-D3	Yes	Clock Disabled	Input Disabled	DMIC_CLK is HIGH-Z with Weak Pull-down
D0-D3	No	Clock Disabled	Input Disabled	DMIC_CLK is HIGH-Z with Weak Pull-down
D4	-	Clock Disabled	Input Disabled	DMIC_CLK is HIGH-Z with Weak Pull-down
D5	-	Clock Disabled	Input Disabled	DMIC_CLK is HIGH-Z with Weak Pull-down

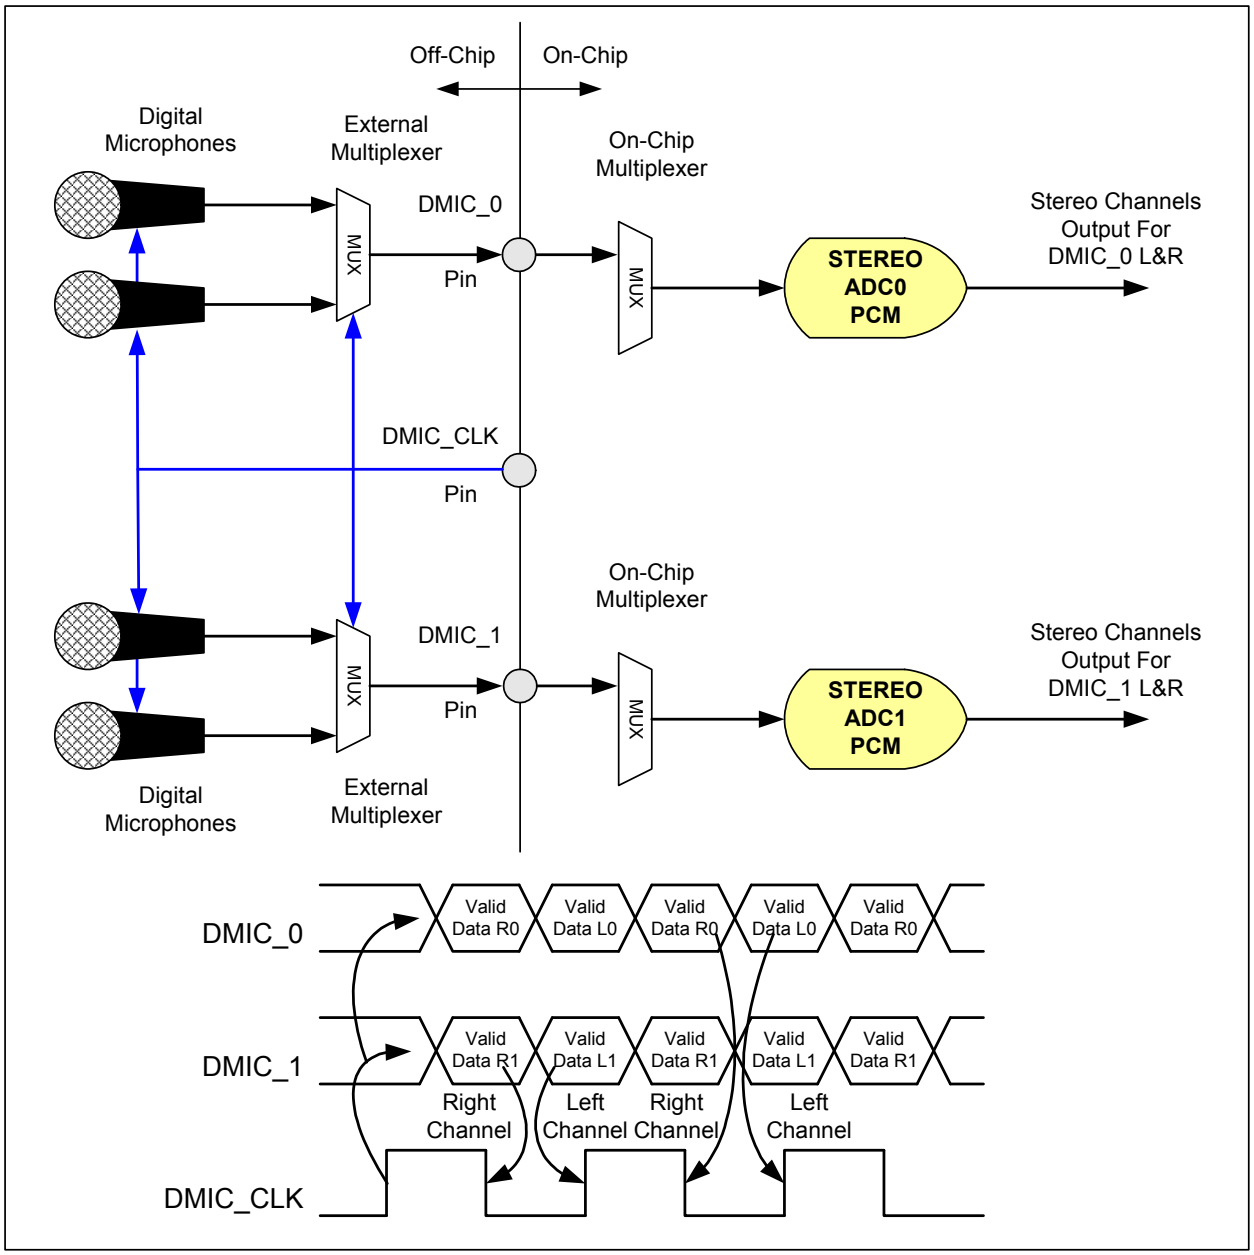
Figure 6. Quad Digital Microphone Configuration



Note: Some Digital Microphone Implementations support data on either edge, in this case the external multiplexer is not required.

2.20. Analog PC-Beep

The codec supports automatic routing of the PC_Beep pin to several outputs when the HD-Link is in reset. The codec will route PC_Beep to ports A, B, and F by default when reset is applied. To prevent pops, beep is not enabled immediately when power is applied. 92HD90 will mute outputs and wait until references and amplifiers have stabilized before enabling beep pass thru after power on reset. To prevent pops when removing power, automatic routing of PC_Beep is not supported in D3cold, D4, or D5.

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

Analog PC-Beep may also be supported during HD-Link Reset if analog PC_Beep is manually enabled before entering reset. Analog PC_Beep is mixed at the port and only ports enabled as outputs will pass PC_Beep. Analog PC_Beep (or a digital equivalent) must not prevent passing WLP when analog PC_Beep is enabled. Analog PC_Beep, when enabled, must not prevent other audio sources from playing (we must mix not mux.) Beeps from ICH (from Beep.sys) can have a frequency of about 37Hz to about 32KHz. Beep duration is programmable from 1mS to about 32 seconds. A typical beep under Windows XP is 500Hz or 2KHz and lasts 75ms or 150mS. Due to external XOR gates used as mixers, the idle state may be logic 0 or logic 1.

PC-Beep may be attenuated and distorted when the CODEC is in D3 depending on the load impedance seen by the output amplifier since all ports are in a low power state while in D3. Load impedances of 10K or larger can support full scale outputs but lower impedance loads will distort unless the output amplitude is reduced.

Analog PC_Beep is not supported in D3 Cold, or the vendor specific states D4/D5.

Analog PC_Beep is typically used during POST to route error beep codes to internal speakers for diagnostic purposes. When using a legacy OS such as DOS, analog PC_Beep routes “Bell” and “Alarm” tones from the south bridge to internal speakers or headphones. Keyboard controller “Key-click” sounds are also routed to internal speakers using the analog beep function in both Windows and legacy operating systems.

2.20.1. PC_Beep Activity Monitor

An activity monitor will allow the cap-less headphone amplifiers to remain in shutdown when the function group is in D3 until the beep pin is active and then quickly change to an active state (within 10mS) to pass the beep tone.

Beep activity monitoring is only required when the analog beep path is enabled and the CODEC or amplifier is in a low power state (D3).

2.20.1.1. Input Characteristics:

- There is no correlation between frequency of the tone and duration of the tone.
- There will always be at least one complete cycle
- A minimum input level of -23dBV (200mVpp) is required for proper detection. (Inputs are typically driven by 3.3V CMOS logic followed by 12-20dB attenuation and filtering)
- Beeps from ICH (from Beep.sys) can have a frequency of about 37Hz to about 32KHz and are 1-bit (PFM)
- Beeps from the Keyboard or system management controller are typically PWM (rate unknown but typically 48KHz or less.)
- Beep duration may be from 1mS to ~32 seconds if provided by ICH under OS control.
- A typical beep under Windows XP is 500Hz or 2KHz and lasts 75ms or 150mS
- Due to external XOR gates used as mixers, the idle state may be logic 0 or logic 1

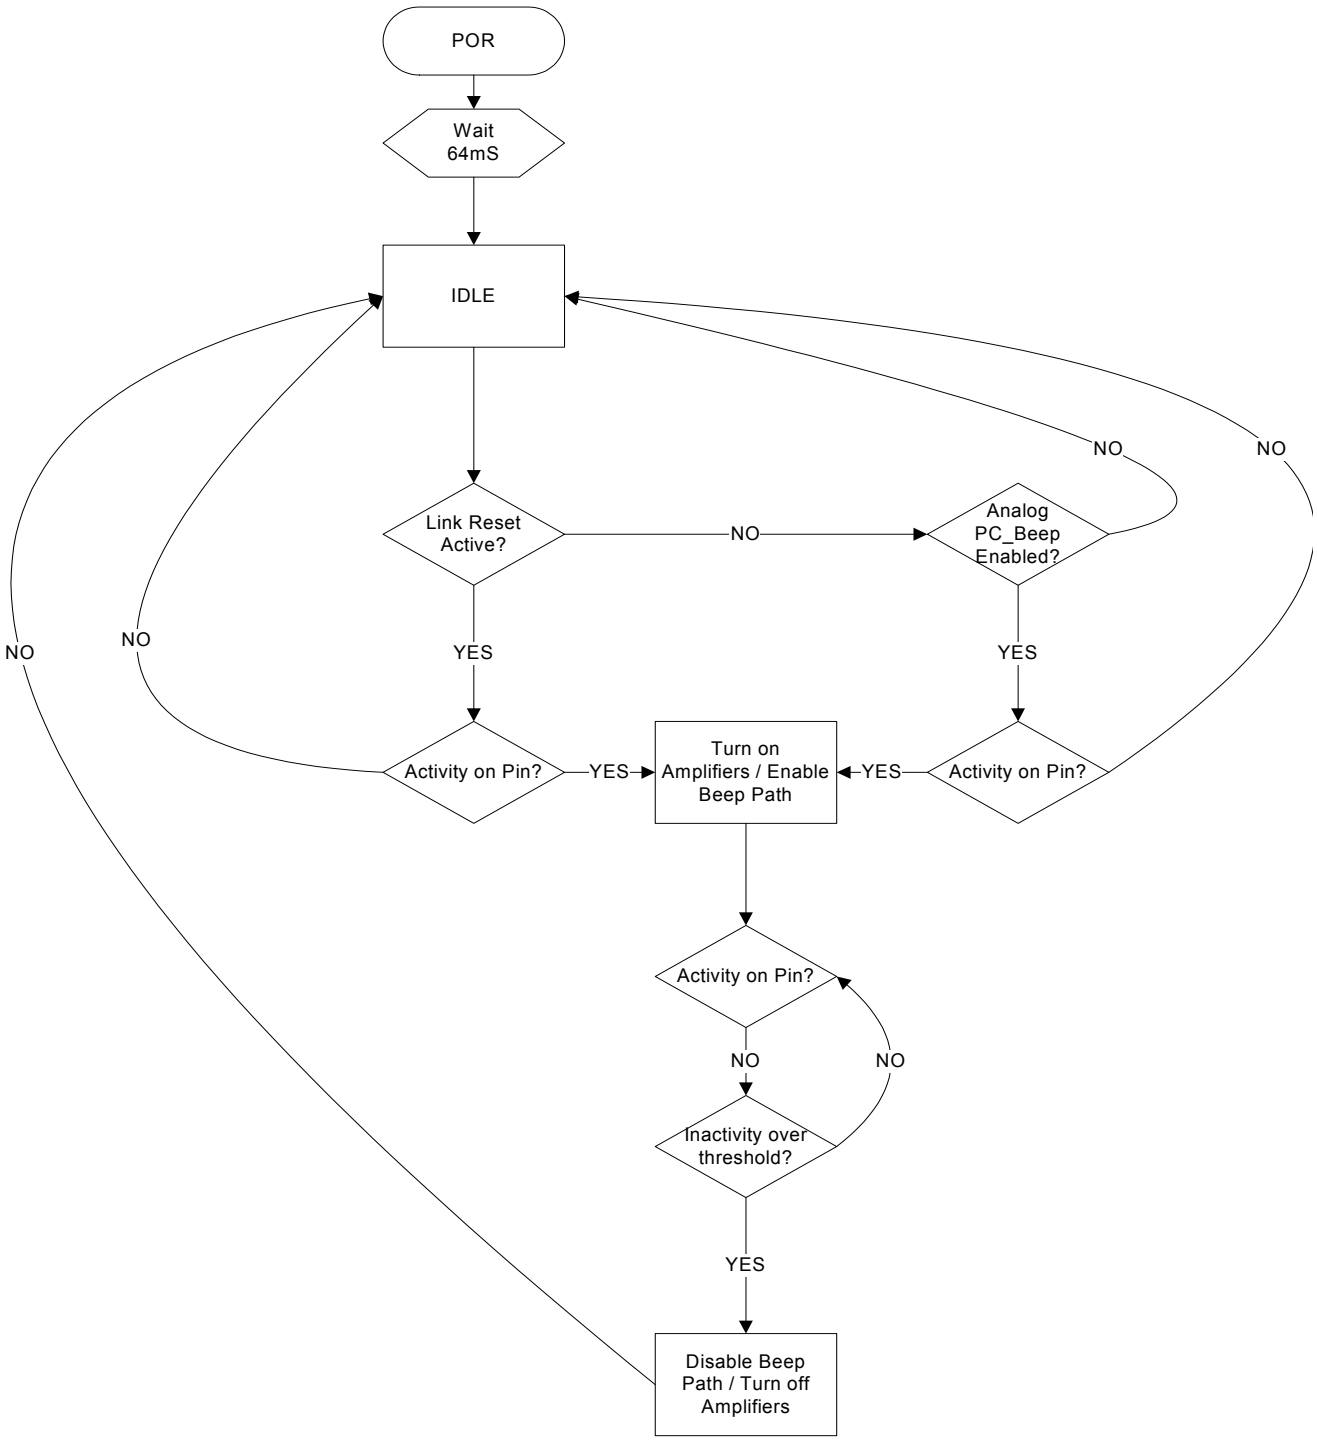
2.20.1.2. Firmware/Software Requirements:

The reconfiguration outlined in this chapter must be enabled by default (without the help of firmware or OS driver.)

This autonomous mode must not interfere with normal operation.

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

Figure 7. Analog PCBeep Flow Chart



Digital detector will detect the “BEEP_SENSE” following the state machine in Figure above and output a signal called “BEEP_PRESENCE”. BEEP_PRESENCE is 1 when the state is Beep _Presence. Otherwise, it is 0.

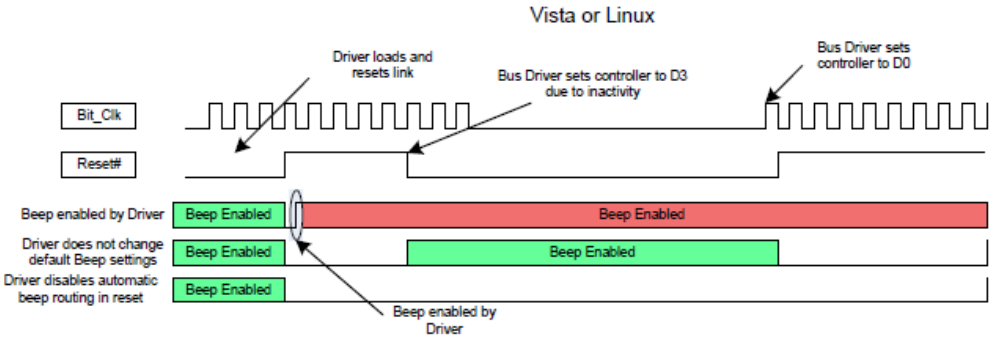
In the 1ms window, the signal will be sampled and counted in first 500us of 1ms window. The counter will be reset during the second 500us of 1ms window. So the actual sample period is 500us. The

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

main clock is typically 810KHZ. The threshold_high is 150 cycles (~37%) and the threshold_low is 30 cycles (~7.5%).

If BEEP_PRESENCE=1, it will be cleared until counter is lower than threshold in 1ms window and it repeat for N times. N(1 is for 1ms) can be programmable to one among 64ms, 64ms*2, 64ms*4 and 64ms*8.

2.20.1.3. Logic control



- **Phase 1:** analog beep auto-routing phase in the period after digital POR, before the first rising edge of link reset.
  - Once Analog PCbeep is detected(BEEP_PRESENCE=1) after 64ms delays (after POR), the Amplifier will be turned on(port_pwd=0, port_output_en=1, there is a timing between these two signals) and analog_beep_en=1. If BEEP_PRESENCE=0 for longer than the threshold time, the amplifiers will be turned off to save power and prevent unwanted system noise from being heard.
- **Phase 2:** When not in phase 1
  - If analog beep function is disabled by driver. Analog beep auto-detect will also be disabled.
  - If analog beep function is enabled by driver.

Once analog PCbeep is detected(BEEP_PRESENCE=1), analog pc_beep will be enabled

If in D0-D2, enabled simply means muting or un-muting beep to avoid hearing system noise on the beep input pin but it is acceptable to turn off port amplifiers if not currently used by DACs, mixer, or beep to save power.

If in D3, enabled means that the necessary amplifiers are turned on so that the beep signal may be heard on all ports configured as outputs (see analog pc-beep description section above)

All needed amplifiers are enabled until BEEP_PRESENCE=0 for longer than the idle threshold

2.21. Digital PC-Beep

This block uses an 8-bit divider value to generate the PC beep from the 48kHz HD Audio Sync pulse. The digital PC_Beep block generates the beep tone on all Pin Complexes that are currently configured as outputs. The HD Audio spec states that the beep tone frequency = (48kHz HD Audio SYNC rate) / (4*Divider), producing tones from 47 Hz to 12 kHz (logarithmic scale). Other audio sources are disabled when digital PC_Beep is active.

It should be noted that digital PC Beep is disabled if the divider = 00h.

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

PC-Beep may be attenuated and distorted when the CODEC is in D3 depending on the load impedance seen by the output amplifier since all ports are in a low power state while in D3. Load impedances of 10K or larger can support full scale outputs but lower impedance loads will distort unless the output amplitude is reduced. Digital PC_Beep requires a clock to operate and the CODEC will prevent the system from stopping the bus clock while in D3 by setting the Clock_Stop_OK bit to 0 to indicate that the part requires a clock.

2.22. Headphone Drivers

The codec implements headphone capable outputs on some ports. The Microsoft Windows Logo Program allows up to the equivalent of 100ohms in series. However, an output level of +3dBV at the pin is required to support 300mV at the jack with a 32ohm load and 1V with a 320 ohm load. Microsoft allows device and system manufactures to limit output voltages to address EU safety requirements. (WLP 3.09 - please refer to the latest Windows Logo Program requirements from Microsoft.) The 92HD90 codec does not implement power limiting. Power limiting may be implemented through the use of an external series resistance.

Although 3 Headphone amplifiers are present, only two may be used simultaneously. Headphone performance will degrade if more than one port is driving a 32 ohm load.

2.23. GPIO

2.23.1. GPIO Pin mapping and shared functions

GPIO #	48 pin package	40 pin package	Supply	SPDIF In	SPDIF Out	EAPD	GPI/O	VrefOut	DMIC	Pull Up	Pull Down
0	46	38	DVDD		YES		YES		IN		50K
1	2	2	DVDD				YES		CLK		50K
2	4	3	DVDD				YES		IN		50K
3	48	40	DVDD		YES		YES		IN		50K
4	44		DVDD				YES				50K

2.23.2. Digital Microphone/GPIO Selection

2 functions are available on the DMIC_CLK/GPIO1 and the DMIC_0/GPIO2 pins. To determine which function is enabled, the order of precedence is followed:

1. If GPIOs are not enabled through the AFG, then at reset, the pins are pulled low by an internal pull-down resistor.
2. If the GPIO 1 is enabled, the 2 DMIC pins become mute (unless programmed for GPIO or SPDIF use) and pin2 becomes GPIO with an internal pull-down.
3. If GPIO2 is enabled through the AFG, pin 4 (3 on 40-pin package) becomes a GPIO and is pulled low by an internal pull-down resistor.
4. If the port is enabled as an input, the digital microphone will be used.
5. If the port is not enabled as an input or if the pin is configured as a GPIO, the digital microphone path will be mute.

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

2.23.3. SPDIF_OUT/GPIO/DMIC Selection

3 functions are available on the SPDF0/GPIO3/DMIC1 and SPDF1/GPIO0/DMIC1 pins. To determine which function is enabled, the order of precedence is followed:

1. Default at power-on is SPDIF_OUT/DMIC1 for pin 48 (40) and SPDIF_OUT/DMIC1 for pin 46(38)
2. If GPIO is enabled for that pin, it overrides the SPDIF_OUT and DMIC functions for that pin.
3. If the GPIO function is not enabled for that pin, then the DMIC or SPDIF_OUT function may be enabled by setting the pin input or output enable to 1, respectively. (Setting input and output enable to 1 at the same time will only enable DMIC)

Note: If the pin selected for DMIC1 input is configured as an output or GPIO, the DMIC block will behave as if silence is present at the input.

GPIO3 Enable	Dig0Pin Input Enable	Dig0Pin Output Enable	Selected by DMIC1Vol (NID 0x12)	Function
0	0	0	NA	Unused (input)
	0	1	NA	SPDIF0 output
	1	NA	No	Unused (input)
			Yes	DMIC1 input
1	NA	NA	NA	GPIO3

Table 18. Dig0Pin (Pin 48/40) Function Selection

GPIO0 Enable	Dig1Pin Input Enable	Dig1Pin Output Enable	Selected by DMIC1Vol (NID 0x12)	Function
0	0	0	NA	Unused (input)
	0	1	NA	SPDIF1 output
	1	NA	No	Unused (input)
			Yes	DMIC1 input
1	NA	NA	NA	GPIO0

Table 19. Dig1Pin (Pin 46/38) Function Selection

2.24. HD Audio ECR 15b support

The codec implements complete support for the HDA015-B specification building on the support already present in previous products. HDA015-B features supported are:

1. Persistence of many configuration options through bus and function group reset.
2. The ability to support port presence detect in D3 even when the HD Audio bus is in a low power state (no clock.)
3. Fast resume times from low power states: 1ms D1 to D0, 2ms D2 to D0, 10mS D3 to D0.
4. Notification if persistent register settings have been unexpectedly reset.
5. SPDIF Out active in D3 (required)
6. The ability to notify the driver that a clock is necessary so entering D3 with the clock stopped is not permissible

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

2.25. Digital Core Voltage Regulator

The digital core operates from 1.8V (+/- 10%). Many systems require that the CODEC use a single 3.3V digital supply, so an integrated regulator is included on die. The regulator uses pin 9, DVDD, as its voltage source. The output of the LDO is connected to pin 1 and the digital core. A 10uF capacitor must be placed on pin 1 for proper load regulation and regulator stability.

The digital core voltage regulator is only dependent on DVDD. DVDDIO may be either 3.3 or 1.5V and may precede or follow DVDD in sequence. The CODEC digital logic and I/O (unless referenced to AVDD) will operate in the absence of AVDD. DVDD and AVDD supply sequencing for the application of power and the removal of power is neither defined nor guaranteed. It is common for desktop systems to supply AVDD from the system standby supply and the CODEC will tolerate, indefinitely, the condition where AVDD is active but DVDD and DVDDIO are inactive.

2.26. Analog Core Voltage Regulator

Many systems provide only a noisy 5 volt supply that is inappropriate for analog audio so an integrated regulator is included on die to generate the core analog supply of 4.5V. The regulator uses AVDD1 as its voltage source. A 10uF capacitor must be placed on the LDO output pin for proper load regulation and regulator stability. 92HD66C may be ordered with the analog core LDO enabled (5V operation) or bypassed (3.3V operation).

2.27. Combo Jack

The codec implements a sophisticated microphone detection algorithm to differentiate between headphones and headsets when implementing 4-conductor “combo” jacks. A programmable sense window (2s to ∞) provides flexibility in managing problematic slow plug insertions and partial insertions. Programmable de-bounce, anti-pop delay, and headphone-microphone unsolicited response delay controls help ensure a robust, pleasing, experience for the end user. Support for a lanyard (“turbo”) switch using IDT’s driver further enhances combo-jack implementations by supporting many common cellular headsets.

3. CHARACTERISTICS

3.1. Audio Fidelity

- 5V
  - DAC SNR: >95dB, A-Weighted 4.75V - 5.25V
  - ADC SNR: >90dB, A-Weighted 4.75V - 5.25V
- 3.3V
  - DAC SNR: >90dB, A-Weighted 3.3V
  - ADC SNR: >85dB, A-Weighted 3.3V

3.2. Electrical Specifications

3.2.1. Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 92HD66C. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Item	Pin	Maximum Rating
Analog maximum supply voltage	AVdd	6 Volts
Digital maximum supply voltage	DVdd	5.5 Volts
	PVdd	6 Volts
VREFOUT output current		5 mA
Voltage on any pin relative to ground		Vss - 0.3V to Vdd + 0.3V
Operating temperature		0 ^{o}C to +70 ^{o}C
Storage temperature		-55 ^{o}C to +125 ^{o}C
Soldering temperature		Soldering temperature information for all available in the package section.

Table 20. Electrical Specification: Maximum Ratings

3.2.2. Recommended Operating Conditions

Parameter		Min.	Typ.	Max.	Units
Power Supplies	DVDD_Core	1.6	1.8	1.98	V
	DVDD_IO (3.3V signaling)	3.135	3.3	3.465	V
	DVDD_IO (1.5V signaling)	1.418	1.5	1.583	V
Power Supply Voltage	+ 3.3V Digital	3.135	3.3	3.465	V
	+ 4.75V Analog	4.500	4.750	5.000	V

ESD: The 92HD66C is an ESD (electrostatic discharge) sensitive device. The human body and test equipment can accumulate and discharge electrostatic charges up to 4000 Volts without detection. Even though the 92HD66C implements internal ESD protection circuitry, proper ESD precautions should be followed to avoid damaging the functionality or performance.

3.3. 92HD66C Analog Performance Characteristics

- 5V AVDD

($T_{ambient}$ = 25 ºC, AVdd = 4.75V (4.5-5.25V), DVdd = 3.3V ± 5% or 1.8V± 10%, AVss=DVss=0V; 20Hz to 20KHz swept sinusoidal input; Sample Frequency = 48 kHz; 0dB FS = 1Vrms for AVdd = 4.75V, 10KΩ//50pF load, Testbench Characterization BW: 20 Hz – 20 kHz, 0 dB settings on all gain stages)

- 3.3V AVDD

($T_{ambient}$ = 25 ºC, AVdd = 3.3V, DVdd = 3.3V ± 5% or 1.8V ± 10%, AVss=DVss=0V; 20Hz to 20KHz swept sinusoidal input; Sample Frequency = 48 kHz; 0dB FS = 0.707Vrms for AVdd = 3.3V, 10KΩ//50pF load, Testbench Characterization BW: 20 Hz – 20 kHz, 0 dB settings on all gain stages)

JESD22-C101		All	4			Class

Table 22. Analog Performance

1.Dynamic Range is the ratio of the full scale signal to the noise output with a -60dBFS signal as defined in AES17 as SNR in the presence of signal and outlined in AES6id, measured “A weighted” over 20 Hz to 20 kHz bandwidth.
2.Ratio of Full Scale signal to idle channel noise output is measured “A weighted” over a 20 Hz to a 20 kHz bandwidth. (AES17-1991 Idle Channel Noise or EIAJ CP-307 Signal-to-noise Ratio).
3.THD+N ratio as defined in AES17 and outlined in AES6id,non-weighted, swept over 20 Hz to 20 kHz bandwidth as required by WLP 3.09. Results at the jack are dependent on external components and will likely be 1 - 2dB worse.
4.48 kHz or 44.1 kHz Sample Frequency. -1dB upper band limit. -3dB lower band limit.
5.Peak-to-Peak Ripple over Passband meets ± 0.125dB limits, 48 kHz or 44.1 kHz Sample Frequency. 1dB limit.
6.Stop Band rejection determines filter requirements. Out-of-Band rejection determines audible noise.
7.The integrated Out-of-Band noise generated by the DAC process, during normal PCM audio playback, over a bandwidth 28.8 to 100 kHz, with respect to a 1 Vrms DAC output.
8.Boost gain may be within +/-2dB of target, but actual gain will always ensure that the WLP FSIV requirement will be met and that the boost implementation will not interfere with the +/-0.5dB gain accuracy for the ADC record gain as exposed in the ADC mux widget.
9.± 1dB limits for Line Output & 0 dB gain, at -20dBV
10.Spurious tone rejection is tested with ADC dither enabled and compared to ADC performance without dither.
11.All functions/converters active, pin complexes enabled, two FDX streams, line (10Kohm) loads. Add 24mA analog current per stereo 32 ohm headphone.
12.One stereo DAC and corresponding pin widgets enabled (playback mode)
13.Mixer enabled
14.Idle measurement D3 set for minimum clicks/pops (biases and min. amps. on)
15.Can be set to 50% or 80% of AVdd.
16.Designed to mimic 80% and 50% of 3.3V. 80% setting is nominal 2.6V, 50% setting is nominal 1.6V

3.5.2. SPDIF Timing

Parameter	Definition	Symbol	Min	Typ	Max	Units
SPDIF_OUT Frequency	highest rate of encoded signal 64 times the sample rate		2.8224	3.072	12.288	MHz
SPDIF_OUT unit interval	1/(128 times the sample rate)	UI	177.15	162.76	40.69	ns
SPDIF_OUT jitter	SPDIF_OUT jitter				4.43	ns
SPDIF_OUT rise time		T_rise			15	ns
SPDIF_OUT fall time		T_fall			15	ns

Table 25. SPDIF Timing

3.5.3. Digital Microphone Timing

Parameter	Definition	Symbol	Min	Typ	Max	Units
DMIC_CLK Frequency	Average DMIC_CLK frequency		1.176	2.352	4.704	MHz
DMIC_CLK Period	Period of DMIC_CLK	Tdmic_cyc	850.34	425.17	212.59	ns
DMIC_CLK jitter	DMIC_CLK jitter				5000	ps
DMIC Data setup	Setup for the microphone data at both rising and falling edges of DMIC_CLK	Tdmic_su	5			ns
DMIC Data hold	Hold for the microphone data at both rising and falling edges of DMIC_CLK	Tdmic_h	5			ns

Table 26. Digital Mic timing

3.5.4. GPIO Characteristics

Parameter	Definition	Symbol	Min	Typ	Max	Units
Input High Voltage	input level at or above which a 1 is reliably recorded	Vih	0.6 x VDD			V
Input Low Voltage	input level at or below which a 0 is reliably recorded VDD may be DVDD or AVDD	Vil			0.35 x VDD	V
Output High Voltage	iout = 4mA VDD may be DVDD or AVDD depending on pin	Voh	0.9 x VDD			V
Output Low Voltage	iout = -4mA VDD may be DVDD or AVDD depending on pin	Vol			0.1 x VDD	V
Input rise/fall time	transition time between 10% and 90% of supply	T_rise/T_fall			10	ns
Input/Tristate High Leakage Current	Vin = VDD VDD may be DVDD or AVDD depending on pin (does not include pull-up or pull-down resistor if present)			0.5		uA
Input/Tristate Low Leakage Current	Vin = 0 VDD may be DVDD or AVDD depending on pin (does not include pull-up or pull-down resistor if present)			-50		uA

6.2. Widget Descriptions

Widget Name	Description
Root	Root Node
AFG	Audio Function Group
Port X	Port X (A, B, Etc.) Pin Widget
Port MonoOut	Port MonoOut Pin Widget (output only)
DigMic N	Digital Microphone Pin Widget (N represents the instance)
DACN	Stereo Output Converter to DAC (N represents the instance)
ADCN	Stereo Input Converter to ADC (N represents the instance)
ADCNMux	ADC N Mux with volume and mute
Mono Mux	Mono output source select
Mono Mix	Stereo to mono conversion
Mixer	Input/Output Mixer (Input Ports, DACs)
MixerOutVol	Volume control for analog mixer
SPDIFOutN	Digital Output Converter for SPDIF_Out (N represents the instance)
DigNPin	Digital I/O Pin for SPDIF In/Out (N represents the instance)
PCBeep	Digital PC Beep Widget
InPortNMux	Input port pre-select for mixer (N represents the instance)
VSWN	Vendor Specific Widget (N represents the instance)

Table 31. Widget Descriptions

6.3. Reset Key

Abbreviation	Description
POR	Power On Reset.
SAFG	Single AFG Reset - One single write to the Reset Verb in the AFG Node.
DAFG	Double AFG Reset - Two consecutive Single AFG Resets with only idle frames (if any) and no Link Resets between.
S&DAFG	Single And Double AFG Reset - Either one will cause reset.
LR	Link Reset - Level sensitive reset anytime the HDA Reset is set low.
ELR	Exiting Link Reset - Edge sensitive reset any time the HDA Reset transitions from low to high.
ULR	Unexpected Link Reset - Level sensitive reset anytime the HDA Reset is set low when the ClkStopOK indicator is currently set to 0.
PS	Power State Change - Reset anytime the Actual Power State changes for the Widget in question.

7.3. Pin Table for 48-Pin

Pin Name	Pin Function	I/O	Internal Pull-up Pull-down	QFN location
DVDD_LV	1.5V Digital Core Regulator Filter Cap	O(Power)	None	1
DMIC_CLK/GPIO1	Digital Mic Clock Output/GPIO1	I/O(Digital)	60K Pull-down	2
DVDD_IO	Reference Voltage (1.5V or 3.3V)	I(Power)	None	3
DMIC0/GPIO2	Digital Mic 01 Input/GPIO2	I/O(Digital)	60K Pull-down	4
SDATA_OUT	HD Audio Serial Data output from controller	I(Digital)	None	5
BITCLK	HD Audio Bit Clock	I(Digital)	None	6
DVSS	Digital Ground	I(Digital)	None	7
SDATA_IN	HD Audio Serial Data Input to controller	I/O(Digital)	None	8
DVDD	Digital Vdd= 3.3V	I(Power)	None	9
SYNC	HD Audio Frame Sync	I(Digital)	None	10
RESET#	HD Audio Reset	I(Digital)	None	11
PCBeep	PC Beep Input	I(Analog)	None	12
SENSE_A	Jack insertion detection	I(Analog)	None	13
SENSE_B	Jack insertion detection	I(Analog)	None	14
PORTE_L	Port E Left	I/O(Analog)	None	15
PORTE_R	Port E Right	I/O(Analog)	None	16
PORTF_L	Port F Left	I/O(Analog)	None	17
PORTF_R	Port F Right	I/O(Analog)	None	18
PORTC_L	Port C Left	I/O(Analog)	None	19
PORTC_R	Port C Right	I/O(Analog)	None	20
VREFFILT	Analog Virtual Ground	O(Analog)	None	21
CAP 2	ADC reference bypass capacitor	O(Analog)	None	22
VREFOUT-E	Reference Voltage out (for mic bias)	O(Analog)	None	23
VREFOUT-C	Reference Voltage out (for mic bias)	O(Analog)	None	24
Mono_Out	Mono output port	O(Analog)	None	25
AVSS1	Analog Ground	I(Analog)	None	26
AVDD1	Analog Vdd=5.0V	I(Analog)	None	27
AVreg	Analog Core LDO decoupling cap	O(Analog)	None	28
PORTA_L (HP)	Port A Output Left	O(Analog)	None	29
PORTA_R (HP)	Port A Output Right	O(Analog)	None	30
PORTB_L (HP)	Port B Output Left	O(Analog)	None	31
PORTB_R (HP)	Port B Output Right	O(Analog)	None	32
AVSS2	Analog Ground	I(Analog)	None	33
V-	Charge-pump negative output	O(Analog)	None	34
CAP-	Charge-pump flying cap -	I(Analog)	None	35
CAP+	Charge-pump flying cap +	O(Analog)	None	36

Table 31. 48-PinTable

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

Pin Name	Pin Function	I/O	Internal Pull-up Pull-down	QFN location
CPVreg	Charge-pump LDO decoupling cap	O(Analog)	None	37
AVDD2	Analog Supply for VREG	I(Power)	None	38
PORTA_L (IN)	Port A Left Input	I(Analog)	None	39
PORTA_R (IN)	Port A Right Input	I(Analog)	None	40
AVSS2	Analog Ground	I(Power)	None	41
PORTB_L(IN)	Port B Left Input	I(Analog)	None	42
PORTB_R(IN)	Port B Right Input	I(Analog)	None	43
GPIO 4	General purpose I/O	I/O (Digital)	60K Pull-Down	44
SPDIFIN	SPDIF Input	I(Digital)	60K Pull-Down	45
SPDF1/GPIO0/ DMIC1	SPDIF 0utput, GPIO0, Digital microphone input	I/O(Digital)	60K Pull-Down	46
EAPD	External Amplifier Power Down (active low)	I/O(Digital)	60K Pull-Up	47
SPDF0/GPIO3/ DMIC1	SPDIF 0utput, GPIO3, Digital microphone input	I/O(Digital)	60K Pull-Down	48

Table 31. 48-PinTable

7.4. Pin Table for 40-Pin

Pin Name	Pin Function	I/O	Internal Pull-up Pull-down	QFN location
DVDD_LV	1.5V Digital Core Regulator Filter Cap	O(Power)	None	1
DMIC_CLK/GPIO1	Digital Microphone clock output or GPIO 1	I/O(Digital)	60K Pull-Down	2
DMIC0/GPIO2	Digital Microphone data input or GPIO 2	I/O(Digital)	60K Pull-Down	3
SDATA_OUT	HD Audio Serial Data output from controller	I(Digital)	None	4
BITCLK	HD Audio Bit Clock	I(Digital)	None	5
SDATA_IN	HD Audio Serial Data Input to controller	I/O(Digital)	None	6
DVDD	Digital Vdd= 3.3V	I(Power)	None	7
SYNC	HD Audio Frame Sync	I(Digital)	None	8
RESET#	HD Audio Reset	I(Digital)	None	9
PCBeep	PC Beep input	I(Analog)	None	10
SENSE_A	Jack insertion detection	I(Analog)	None	11
PORTF_L	Port F Left	I/O(Analog)	None	12
PORTF_R	Port F Right	I/O(Analog)	None	13
PORTC_L	Port C Left	I/O(Analog)	None	14
PORTC_R	Port C Right	I/O(Analog)	None	15
VREFFILT	Analog Virtual Ground	O(Analog)	None	16
CAP 2	ADC reference bypass capacitor	O(Analog)	None	17

Table 32. 40-Pin Table

©2011 INTEGRATED DEVICE TECHNOLOGY, INC.

Pin Name	Pin Function	I/O	Internal Pull-up Pull-down	QFN location
VREFOUT-C	Reference Voltage out drive (intended for mic bias)	O(Analog)	None	18
AVSS1	Analog Ground	I(Power)	None	19
AVDD1	Analog Vdd=5.0V or 3.3V	I(Analog)	None	20
AVreg	Analog Core LDO decoupling cap	O(Analog)	None	21
PORTA_L (HP)	Port A Output Left	O(Analog)	None	22
PORTA_R (HP)	Port A Output Right	O(Analog)	None	23
PORTB_L (HP)	Port B Output Left	O(Analog)	None	24
PORTB_R (HP)	Port B Output Right	O(Analog)	None	25
AVSS2	Analog Ground	I(Power)	None	26
V-	Charge-pump negative output	O(Analog)	None	27
CAP-	Charge-pump flying cap -	I(Analog)	None	28
CAP+	Charge-pump flying cap +	O(Analog)	None	29
CPVreg	Charge-pump LDO decoupling cap	I(Analog)	None	30
AVDD2	Analog Supply for VREG	I(Power)	None	31
PORTA_L(IN)	Port A Left Input	I(Analog)	None	32
PORTA_R(IN)	Port ARight Input	I(Analog)	None	33
AVSS2	Analog Ground	I(Power)	None	34
PORTB_L(IN)	Port B Left Input	I(Analog)	None	35
PORTB_R(IN)	Port B Right Input	I(Analog)	None	36
SPDIFIN	SPDIF Input	I (Digital)	60K Pull-Down	37
SPDF1/GPIO0/ DMIC1	SPDIF output, GPIO0, or digital microphone input	I/O(Digital)	60K Pull-Down	38
EAPD	External Amplifier Power-Down (active low)	I/O(Digital)	60K Pull-Up	39
SPDF0/GPIO3/ DMIC1	SPDIF output, GPIO3, or digital microphone input	I/O(Digital)	60K Pull-Down	40

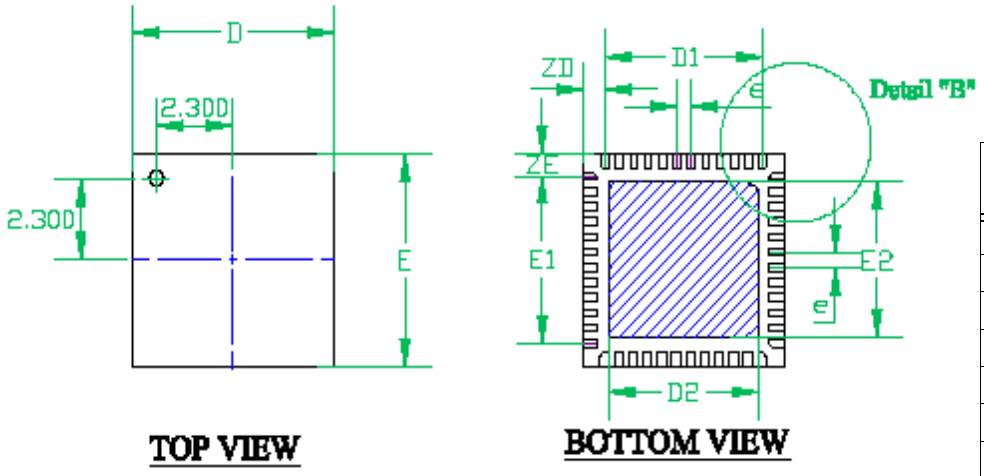
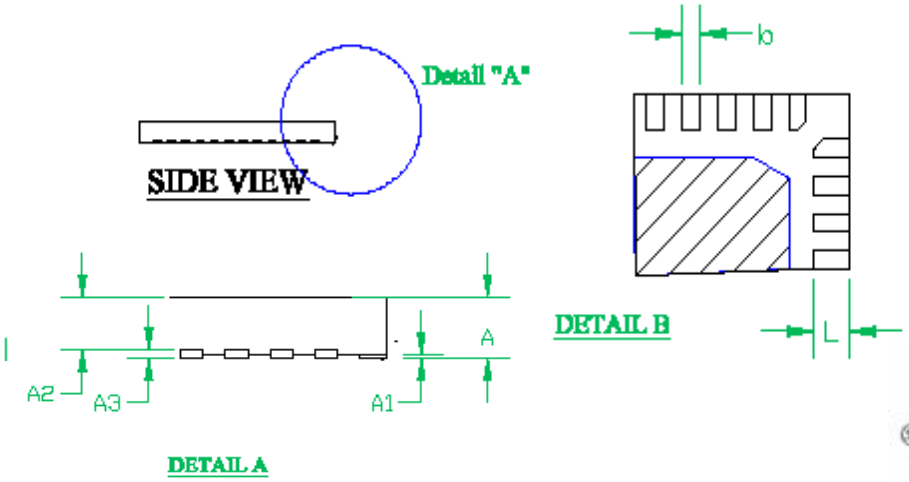
7.5. 48QFN Package Outline and Package Dimensions

Package dimensions are kept current with JEDEC Publication No. 95





Key	QFN Dimensions in mm		
	Min	Nom	Max
A	0.80	0.90	1.0
A1	0.00	0.02	0.05
A3		0.20 REF	
D		7.00 BSC	
D1		5.50 BSC	
E		7.00 BSC	
E1		5.50 BSC	
L	0.35	0.40	0.45
e		0.50 BSC	
R		0.20-0.25	
b	0.18	0.25	0.30
D2	5.50	5.65	5.80
E2	5.50	5.65	5.80
ZD		0.75 BSC	
ZE		0.75 BSC	

Additional Approved Option

7.6. 40QFN Package Outline and Package Dimensions

Package dimensions are kept current with JEDEC Publication No. 95

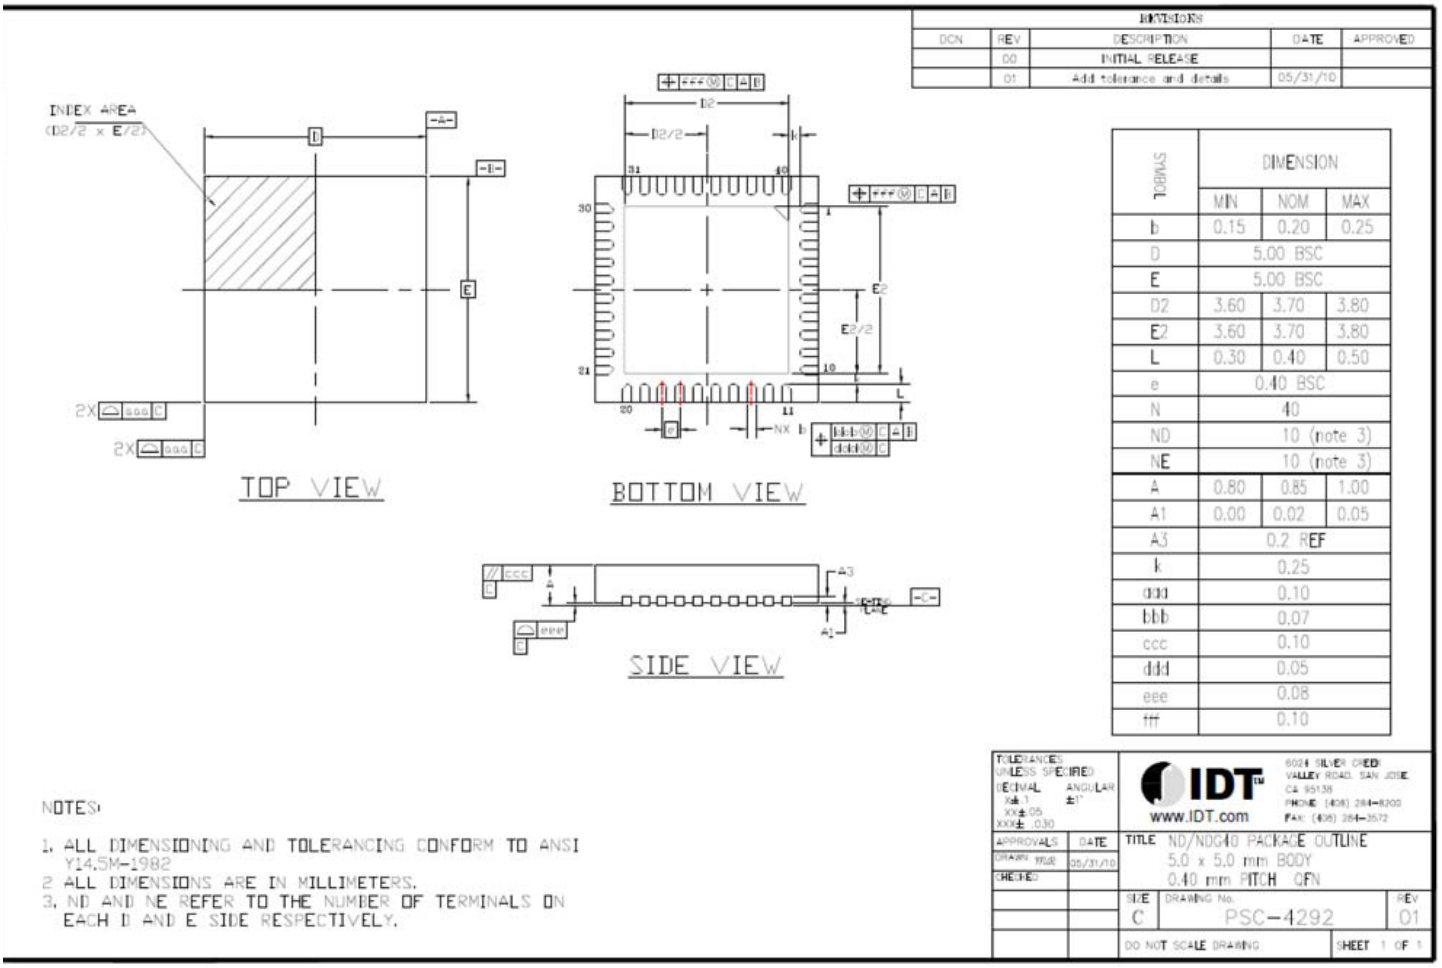

Figure 17. 40QFN Package Diagram

7.7. Pb Free Process- Package Classification Reflow Temperatures

Package Thickness	Volume mm^3 <350	Volume mm^3 350 - 2000	Volume mm^3 >2000
<1.6mm	260 + 0 °C*	260 + 0 °C*	260 + 0 °C*
1.6mm - 2.5mm	260 + 0 °C*	250 + 0 °C*	245 + 0 °C*
> or = 2.5mm	250 + 0 °C*	245 + 0 °C*	245 + 0 °C*
*Tolerance: The device manufacturer/supplier shall assure process compatibility up to and including the stated classification temperature (this means Peak reflow temperature +0 °C. For example 260 °C+0 °C) at the rated MSL level.			

Table 33. Reflow

Note: IDT's package thicknesses are <2.5mm and <350 mm^3, so 260 applies in every case.

8. DISCLAIMER

While the information presented herein has been checked for both accuracy and reliability, manufacturer assumes no responsibility for either its use or for the infringement of any patents or other rights of third parties, which would result from its use. No other circuits, patents, or licenses are implied. This product is intended for use in normal commercial applications. Any other applications, such as those requiring extended temperature range, high reliability, or other extraordinary environmental requirements, are not recommended without additional processing by manufacturer. Manufacturer reserves the right to change any circuitry or specifications without notice. Manufacturer does not authorize or warrant any product for use in life support devices or critical medical instruments.
