Description

The new ACNV260E is an optically coupled gate that combines a AlGaAs light emitting diode and an integrated photo detector housed in a widebody package. ACNV260E is designed and manufactured to comply with EN60079-11 ATEX and IECEx. The distance-through-insulation (DTI) between the emitting diode and photo-detector is at 2mm. The output of the detector IC is an open collector Schottky clamped transistor. The internal shield provides a guaranteed common mode transient immunity specification of 20,000 V/μs at $V_{cm} = 1500V$

This unique design provides maximum ac and dc circuit isolation while achieving TTL compatibility.

The new ACNV260E is suitable for high speed logic interfacing, input/output buffering, as line receivers in environments that conventional line receivers cannot tolerate and are recommended for use in extremely high ground or induced noise environments.

Features

- Compliant to EN60079-11 ATEX and IECEx (375V)
- 2mm DTI
- 13mm creepage and clearance
- 20 kV/μs Minimum Common Mode Rejection (CMR) at $V_{CM} = 1500V$
- High Speed: 10 MBd Typical
- TTL Compatible
- Guaranteed ac and dc performance over temperature: -40°C to +105°C
- Available in 10-Pin widebody packages
- Safety Approval
 - Approval at 5000 Vrms for 1 minute per UL1577
 - CSA

Applications

- High Voltage insulation
- Intrinsic safety circuit
- PCB Board Power System Isolation
- Industrial Equipment Power Isolation

CAUTION: It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

Solder Reflow Profile

Recommended reflow condition as per JEDEC Standard, J-STD-020 (latest revision). Non-Halide Flux should be used.

Notes:

- Peaking circuits may produce transient input currents up to 50mA, 50ns maximum pulse width, provided average current does not exceed 20mA.
- By passing of power supply line is required, with a 0.1 μF ceramic disc capacitor adjacent to each optocoupler as illustrated in Figure 15. Total lead length between both ends of the capacitor and the isolator pins should not exceed 20mm.
- The t_{PLH} propagation delay is measured from the 5 mA point on the falling edge of the input pulse to the 1.5 V point on the rising edge of the output pulse.
- The t_{PHL} propagation delay is measured from the 5 mA point on the rising edge of the input pulse to the 1.5 V point on the falling edge of the output pulse.
- t_{psk} is equal to the worst case difference in t_{PHL} and/or t_{PLH} that will be seen between units at any given temperature and specified test conditions.
- See application section titled "Propagation Delay, Pulse-Width Distortion and Propagation Delay Skew" for more information.
- The t_{ELH} enable propagation delay is measured from the 1.5 V point on the falling edge of the enable input pulse to the 1.5 V point on the rising edge of the output pulse.
- The t_{EHL} enable propagation delay is measured from the 1.5 V point on the rising edge of the enable input pulse to the 1.5 V point on the falling edge of the output pulse.
- CM_H is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state (i.e., $V_O > 2.0\text{ V}$).
- CM_L is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state (i.e., $V_O < 0.8\text{ V}$).
- For sinusoidal voltages, $(dV_{CM} / dt)_{max} = \pi f_{CM} V_{CM(p-p)}$.
- No external pull up is required for a high logic state on the enable input. If the V_E pin is not used, tying V_E to V_{CC} will result in improved CM_R performance.
- Device considered a two-terminal device: pins 1, 2, 3, 4 and 5 shorted together, and pins 6, 7, 8, 9 and 10 shorted together.
- In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage $\geq 6000 V_{rms}$ for one second (leakage detection current limit, $I_{I-O} \leq 5\text{ }\mu\text{A}$).
