

Inverted Logic High CMR Intelligent Power Module and Gate Drive Interface Optocoupler

Data Sheet

Description

The ACPL-M483/P483/W483 fast-speed optocoupler contains a AlGaAs LED and photo detector with built-in Schmitt trigger to provide logic-compatible waveforms, eliminating the need for additional wave shaping. The totem pole output eliminates the need for a pull-up resistor and allows for direct drive Intelligent Power Module or gate drive. Minimized propagation delay difference between devices makes these optocouplers excellent solutions for improving inverter efficiency through reduced switching dead time.

UVLO

Figure 10 and Figure 11 show typical output waveforms during Power-up and Power-down processes.

Notes:

- Derate total package power dissipation, P_T , linearly above $70^\circ C$ free-air temperature at a rate of $4.5 \text{ mW}/^\circ C$ (ACPL-P483/W483) and linearly above $85^\circ C$ free-air temperature at a rate of $0.75 \text{ mW}/^\circ C$ (ACPL-M483).
- Detector requires a V_{CC} of 4.5V or higher for stable operation as output might be unstable if V_{CC} is lower than 4.5V. Be sure to check the power ON/OFF operation other than the supply current.
- Duration of output short circuit time should not exceed $500 \mu s$.
- Input capacitance is measured between pin 1 and pin 3.
- Device considered a two-terminal device: pins 1, 2, and 3 shorted together and pins 4, 5, and 6 shorted together.
- The t_{PLH} propagation delay is measured from the 50% point on the leading edge of the input pulse to the 1.3V point on the leading edge of the output pulse. The t_{PHL} propagation delay is measured from the 50% point on the trailing edge of the input pulse to the 1.3 V point on the trailing edge of the output pulse.
- CM_H is the maximum slew rate of the common mode voltage that can be sustained with the output voltage in the logic high state, $V_O > 2.0V$. CM_L is the maximum slew rate of the common mode voltage that can be sustained with the output voltage in the logic low state, $V_O < 0.8V$. Note: Equal value split resistors ($R_{in}/2$) must be used at both ends of the LED.
- In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage. $4500V_{RMS}$ for one second (leakage detection current limit, $I_{I-O} \leq 5 \mu A$). This test is performed before the 100% production test for partial discharge (Method b) shown in the IEC/EN/DIN EN 60747-5-5 Insulation Characteristics Table, if applicable.
- Pulse Width Distortion (PWD) is defined as $|t_{PHL} - t_{PLH}|$ for any given device.
- The difference of t_{PLH} and t_{PHL} between any two devices under the same test condition.
- Use of a $0.1 \mu F$ bypass capacitor connected between pins V_{CC} and Ground is recommended.
