

### FEATURES

- 64-position digital potentiometer
- 10 k $\Omega$ , 50 k $\Omega$ , 100 k $\Omega$  end-to-end terminal resistance
- Simple up/down digital or manual configurable control
- Midscale preset
- Low potentiometer mode tempco = 10 ppm/ $^{\circ}$ C
- Low rheostat mode tempco = 35 ppm/ $^{\circ}$ C
- Ultralow power, I<sub>DD</sub> = 0.4  $\mu$ A typ and 3  $\mu$ A max
- Fast adjustment time, t<sub>s</sub> = 1  $\mu$ s
- Chip select enable multiple device operation
- Low operating voltage, 2.7 V to 5.5 V
- Automotive temperature range, -40 $^{\circ}$ C to +105 $^{\circ}$ C
- Compact thin SOT-23-8 (2.9 mm  $\times$  3 mm) Pb-free package

### APPLICATIONS

- Mechanical potentiometer and trimmer replacements
- LCD backlight, contrast, and brightness controls
- Portable electronics level adjustment
- Programmable power supply
- Digital trimmer replacements
- Automatic closed-loop control

### GENERAL DESCRIPTION

The AD5227 is Analog Devices' latest 64-step up/down control digital potentiometer<sup>1</sup>. This device performs the same electronic adjustment function as a 5 V potentiometer or variable resistor. Its simple 3-wire up/down interface allows manual switching or high speed digital control. The AD5227 presets to midscale at power-up. When  $\overline{\text{CS}}$  is enabled, the device changes step at every clock pulse. The direction is determined by the state of the U/ $\overline{\text{D}}$  pin (see Table 1). The interface is simple to activate by any host controller, discrete logic, or manually with a rotary encoder or pushbuttons. The AD5227's 64-step resolution, small footprint, and simple interface enable it to replace mechanical potentiometers and trimmers with typically 6 $\times$  improved resolution, solid-state reliability, and design layout flexibility, resulting in a considerable cost savings in end users' systems.

<sup>1</sup> The terms *digital potentiometer* and *RDAC* are used interchangeably.

### FUNCTIONAL BLOCK DIAGRAM

Figure 1.

The AD5227 is available in a compact thin SOT-23-8 (TSOT-8) Pb-free package. The part is guaranteed to operate over the automotive temperature range of -40 $^{\circ}$ C to +105 $^{\circ}$ C.

Users who consider EEMEM potentiometers should refer to some recommendations in the Applications section.

Parameter	Symbol	Conditions	Min	Typ <sup>1</sup>	Max	Unit
INTERFACE TIMING CHARACTERISTICS (applies to all parts <sup>6, 10</sup> )						
Clock Frequency	$f_{CLK}$				50	MHz
Input Clock Pulse Width	$t_{CH}, t_{CL}$	Clock level high or low	10			ns
$\overline{CS}$ to CLK Setup Time	$t_{CSS}$		10			ns
$\overline{CS}$ Rise to CLK Hold Time	$t_{CSH}$		10			ns
$\overline{U/\overline{D}}$ to Clock Fall Setup Time	$t_{UDS}$		10			ns

<sup>1</sup> Typicals represent average readings at 25°C,  $V_{DD} = 5\text{ V}$ .

<sup>2</sup> Resistor position nonlinearity error, R-INL, is the deviation from an ideal value measured between the maximum resistance and the minimum resistance wiper positions. R-DNL measures the relative step change from ideal between successive tap positions. Parts are guaranteed monotonic.

<sup>3</sup> NL and DNL are measured at  $V_W$  with the RDAC configured as a potentiometer divider similar to a voltage output D/A converter.  $V_A = V_{DD}$  and  $V_B = 0\text{ V}$ .

<sup>4</sup> DNL specification limits of  $\pm 1\text{ LSB}$  maximum are guaranteed monotonic operating conditions.

<sup>5</sup> Resistor Terminals A, B, W have no limitations on polarity with respect to each other.

<sup>6</sup> Guaranteed by design and not subject to production test.

<sup>7</sup>  $P_{DISS}$  is calculated from  $(I_{DD} \times V_{DD})$ . CMOS logic level inputs result in minimum power dissipation.

<sup>8</sup> Bandwidth, noise, and settling time are dependent on the terminal resistance value chosen. The lowest R value results in the fastest settling time and highest bandwidth. The highest R value results in the minimum overall power consumption.

<sup>9</sup> All dynamic characteristics use  $V_{DD} = V$ .

<sup>10</sup> All input control voltages are specified with  $t_r = t_f = 1\text{ ns}$  (10% to 90% of  $V_{DD}$ ) and timed from a voltage level of 1.6 V. Switching characteristics are measured using  $V_{DD} = 5\text{ V}$ .

## ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Rating
$V_{DD}$ to GND	-0.3 V, +7 V
$V_A$ , $V_B$ , $V_W$ to GND	0 V, $V_{DD}$
Digital Input Voltage to GND ( $\overline{CS}$ , CLK, $U/\overline{D}$ )	0 V, $V_{DD}$
Maximum Current	
$I_{WB}$ , $I_{WA}$ Pulsed	±20 mA
$I_{WB}$ Continuous ( $R_{WB} \leq 5 \text{ k}\Omega$ , A open) <sup>1</sup>	±1 mA
$I_{WA}$ Continuous ( $R_{WA} \leq 5 \text{ k}\Omega$ , B open) <sup>1</sup>	±1 mA
$I_{AB}$ Continuous ( $R_{AB} = 10 \text{ k}\Omega/50 \text{ k}\Omega/100 \text{ k}\Omega$ ) <sup>1</sup>	±500 $\mu\text{A}$ / ±100 $\mu\text{A}/\pm 50 \mu\text{A}$
Operating Temperature Range	-40°C to +105°C
Maximum Junction Temperature ( $T_{J,max}$ )	150°C
Storage Temperature	-65°C to +150°C
Lead Temperature (Soldering, 10 s – 30 s)	245°C
Thermal Resistance <sup>2</sup> $\theta_{JA}$	230°C/W

<sup>1</sup> Maximum terminal current is bounded by the maximum applied voltage across any two of the A, B, and W terminals at a given resistance, the maximum current handling of the switches, and the maximum power dissipation of the package.  $V_{DD} = 5 \text{ V}$ .

<sup>2</sup> Package power dissipation =  $(T_{J,max} - T_A) / \theta_{JA}$ .

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 5. Pin Configuration

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	CLK	Clock Input. Each clock pulse executes the step-up or step-down of the resistance. The direction is determined by the state of the U/D pin. CLK is a negative-edge trigger. Logic high signal can be higher than V <sub>DD</sub> , but lower than 5.5 V.
2	U/D	Up/Down Selections. Logic 1 selects up and Logic 0 selects down. U can be higher than V <sub>DD</sub> , but lower than 5.5 V.
3	A	Resistor Terminal A. $GND \leq V_A \leq V_{DD}$ .
4	GND	Common Ground.
5	W	Wiper Terminal W. $GND \leq V_W \leq V_{DD}$ .
6	B	Resistor Terminal B. $GND \leq V_B \leq V_{DD}$ .
7	CS	Chip Select. Active Low. Logic high signal can be higher than V <sub>DD</sub> , but lower than 5.5 V.
8	V <sub>DD</sub>	Positive Power Supply, 2.7 V to 5.5 V.

## THEORY OF OPERATION

The AD5227 is a 64-position 3-terminal digitally controlled potentiometer device. It presets to a midscale at system power-on. When  $\overline{CS}$  is enabled, changing the resistance settings is achieved by clocking the CLK pin. It is negative-edge triggered, and the direction of stepping is determined by the state of the  $U/\overline{D}$  input. When the wiper reaches the maximum or the minimum setting, additional CLK pulses do not change the wiper setting.

Figure 24. Functional Block Diagram

Figure 25. AD5227 Equivalent RDAC Circuit

### PROGRAMMING THE DIGITAL POTENTIOMETERS

#### Rheostat Operation

If only the W-to-B or W-to-A terminals are used as variable resistors, the unused terminal can be opened or shorted with W. This operation is called *rheostat mode* and is shown in Figure 26.

Figure 26. Rheostat Mode Configuration

The end-to-end resistance,  $R_{AB}$ , has 64 contact points accessed by the wiper terminal, plus the B terminal contact, assuming that  $R_{WB}$  is used (see Figure 25). Clocking the CLK input steps,  $R_{WB}$  by one step. The direction is determined by the state of  $U/\overline{D}$  pin. The change of  $R_{WB}$  can be determined by the number of clock pulses, provided that the AD5227 has not reached its maximum or minimum scale.  $\Delta R_{WB}$  can, therefore, be approximated as

$$\Delta R_{WB} = \pm \left( CP \times \frac{R_{AB}}{64} + R_W \right) \quad (1)$$

where:

$CP$  is the number of clock pulses.

$R_{AB}$  is the end-to-end resistance.

$R_W$  is the wiper resistance contributed by the on-resistance of the internal switch.

Since in the lowest end of the resistor string a finite wiper resistance is present, care should be taken to limit the current flow between W and B in this state to a maximum pulse current of no more than 20 mA. Otherwise, degradation or possible destruction of the internal switches can occur.

Similar to the mechanical potentiometer, the resistance of the RDAC between the Wiper W and Terminal A also produces a digitally controlled complementary resistance,  $R_{WA}$ . When these terminals are used, the B terminal can be opened or shorted to W. Similarly,  $\Delta R_{WA}$  can be approximated as

$$\Delta R_{WA} = \pm \left( (64 - CP) \frac{R_{AB}}{64} + R_W \right) \quad (2)$$

Equations 1 and 2 do not apply when  $CP = 0$ .

The typical distribution of the resistance tolerance from device to device is process lot dependent. It is possible to have  $\pm 20\%$  tolerance.

#### Potentiometer Mode Operation

If all three terminals are used, the operation is called *potentiometer mode*. The most common configuration is the voltage divider operation as shown in Figure 27.

Figure 27. Potentiometer Mode Configuration

The change of  $V_{WB}$  is known provided that the AD5227 has not reached the maximum or minimum scale. If one ignores the effect of the wiper resistance, the transfer functions can be simplified as

$$\Delta V_{WB} = +\frac{CP}{64}V_A \quad U/\overline{D} = 1 \quad (3)$$

$$\Delta V_{WB} = -\frac{CP}{64}V_A \quad U/\overline{D} = 0 \quad (4)$$

Unlike rheostat mode operation where the absolute tolerance is high, potentiometer mode operation yields an almost ratiometric function of  $CP/64$  with a relatively small error contributed by the  $R_W$  term. The tolerance effect is, therefore, almost canceled. Although the thin film step resistor,  $R_s$ , and CMOS switches resistance,  $R_W$ , have very different temperature coefficients, the ratiometric adjustment also reduces the overall temperature coefficient to 5 ppm/°C except at low value codes where  $R_W$  dominates.

Potentiometer mode operation includes an op amp gain configuration among others. The A, W, and B terminals can be input or output terminals and have no polarity constraint provided that  $|V_{AB}|$ ,  $|V_{WA}|$ , and  $|V_{WB}|$  do not exceed  $V_{DD}$ -to-GND.

## DIGITAL INTERFACE

The AD5227 contains a 3-wire serial input interface. The three inputs are clock (CLK), chip select ( $\overline{CS}$ ), and up/down control ( $U/\overline{D}$ ). These inputs can be controlled digitally for optimum speed and flexibility

When  $\overline{CS}$  is pulled low, a clock pulse increments or decrements the up/down counter. The direction is determined by the state of the  $U/\overline{D}$  pin. When a specific state of the  $U/\overline{D}$  remains, the device continues to change in the same direction under consecutive clocks until it comes to the end of the resistance setting. All digital inputs,  $\overline{CS}$ , CLK, and  $U/\overline{D}$  pins, are protected with a series input resistor and a parallel Zener ESD structure as shown in Figure 28.

Figure 28. Equivalent ESD Protection Digital Pins

## TERMINAL VOLTAGE OPERATION RANGE

The AD5227 is designed with internal ESD protection diodes (Figure 29), but the diodes also set the boundary of the terminal

operating voltages. Voltage present on Terminal A, B, or W that exceeds  $V_{DD}$  by more than 0.5 V is clamped by the diode and, therefore, elevates  $V_{DD}$ . There is no polarity constraint between  $V_{AB}$ ,  $V_{WA}$ , and  $V_{WB}$ , but they cannot be higher than  $V_{DD}$ -to-GND.

## POWER-UP AND POWER-DOWN SEQUENCES

Because of the ESD protection diodes, it is important to power on  $V_{DD}$  before applying any voltage to Terminals A, B, and W. Otherwise, the diodes are forward-biased such that  $V_{DD}$  can be powered unintentionally and can affect the rest of the system circuit. Similarly,  $V_{DD}$  should be powered down last. The ideal power-on sequence is in the following order: GND,  $V_{DD}$ ,  $V_{A/B/W}$ , and digital inputs.

Figure 29. Maximum Terminal Voltages Set by  $V_{DD}$  and GND

## LAYOUT AND POWER SUPPLY BIASING

It is a good practice to use compact, minimum lead length layout design. The leads to the input should be as direct as possible with a minimum conductor length. Ground paths should have low resistance and low inductance. It is also good practice to bypass the power supplies with quality capacitors. Low ESR (equivalent series resistance) 1  $\mu$ F to 10  $\mu$ F tantalum or electrolytic capacitors should be applied at the supplies to minimize any transient disturbance and filter low frequency ripple.

Figure 30 illustrates the basic supply bypassing configuration for the AD5227. The ground pin of the AD5227 is a digital ground reference that should be joined to the common ground at a single point to minimize the digital ground bounce.

Figure 30. Power Supply Bypassing

## APPLICATIONS

### MANUAL CONTROL WITH TOGGLE AND PUSHBUTTON SWITCHES

The AD5227's simple interface allows it to be used with mechanical switches for simple manual operation. The states of the  $\overline{CS}$  and  $U/\overline{D}$  can be selected by toggle switches and the CLK input can be controlled by a pushbutton switch. Because of the numerous bounces due to contact closure, the pushbutton switch should be debounced by flip-flops or by the ADM812 as shown in Figure 31.

Figure 31. Manual Push Button Up/Down Control

### MANUAL CONTROL WITH ROTARY ENCODER

Figure 32 shows another way of using AD5227 to emulate mechanical potentiometer in a rotary knob operation. The rotary encoder U1 has a C ground terminal and two out-of-phase signals, A and B. When U1 is turned clockwise, a pulse generated from the B terminal leads a pulse generated from the A terminal and vice versa. Signals A and B of U1 pass through a quadrature decoder U2 that translates the phase difference between A and B of U1 into compatible inputs for U3 AD5227. Therefore, when B leads A (clockwise), U2 provides the AD5227 with a logic high  $U/\overline{D}$  signal, and vice versa. U2 also filters noise, jitter, and other transients as well as debouncing the contact bounces generated by U1.

Figure 32. Manual Rotary Control

### ADJUSTABLE LED DRIVER

The AD5227 can be used in many electronics-level adjustments such as LED drivers for LCD panel backlight control. Figure 33 shows an adjustable LED driver. The AD5227 sets the voltage across the white LED D1 for the brightness control. Since U2 handles up to 250 mA, a typical white LED with  $V_F$  of 3.5 V requires a resistor, R1, to limit the U2 current. This circuit is simple but not power-efficient, therefore the U2 shutdown pin can be toggled with a PWM signal to conserve power.

Figure 33. Low Cost Adjustable LED Driver

### ADJUSTABLE CURRENT SOURCE FOR LED DRIVER

Since LED brightness is a function of current rather than forward voltage, an adjustable current source is preferred over a voltage source as shown in Figure 34.

Figure 34. Adjustable Current Source for LED Driver

The load current can be found as the  $V_{WB}$  of the AD5227 divided by  $R_{SET}$ .

$$I_D = \frac{V_{WB}}{R_{SET}} \quad (5)$$

The U1 ADP3333ARM-1.5 is a 1.5 V LDO that is lifted above or lowered below 0 V. When  $V_{WB}$  of the AD5227 is at minimum, there is no current through D1, so the GND pin of U1 would be at  $-1.5$  V if U3 were biased with the dual supplies. As a result, some of the U2 low resistance steps have no effect on the output until the U1 GND pin is lifted above 0 V. When  $V_{WB}$  of the AD5227 is at its maximum,  $V_{OUT}$  becomes  $V_L + V_{AB}$ , so the U1 supply voltage must be biased with adequate headroom. Similarly, a PWM signal can be applied at the U1 shutdown pin for power efficiency. This circuit works well for a single LED.

**ADJUSTABLE HIGH POWER LED DRIVER**

Figure 35 shows a circuit that can drive three to four high power LEDs. ADP1610 is an adjustable boost regulator that provides the voltage headroom and current for the LEDs. The AD5227 and the op amp form an average gain of 12 feedback network that servos the  $R_{SET}$  voltage and ADP1610's FB pin 1.2 V band gap reference voltage. As the loop is set, the voltage across  $R_{SET}$  is regulated around 0.1 V and adjusted by the digital potentiometer.

$$I_{LED} = \frac{V_{R_{SET}}}{R_{SET}} \tag{6}$$

$R_{SET}$  should be small enough to conserve power but large enough to limit maximum LED current. R3 should also be used in parallel with AD5227 to limit the LED current within an achievable range. A wider current adjustment range is possible by lowering the R2 to R1 ratio, as well as changing R3 accordingly.

Figure 35. Adjustable Current Source for LEDs in Series

**AUTOMATIC LCD PANEL BACKLIGHT CONTROL**

With the addition of a photocell sensor, an automatic brightness control can be achieved. As shown in Figure 36, the resistance of the photocell changes linearly but inversely with the light output. The brighter the light output, the lower the photocell resistance and vice versa. The AD5227 sets the voltage level that is gained up by U2 to drive N1 to a desirable brightness. With the photocell acting as the variable feedback resistor, the change in the light output changes the R2 resistance, therefore causing U2 to drive N1 accordingly to regulate the output. This simple low cost implementation of the LED controller can compensate for the temperature and aging effects typically found in high power LEDs. Similarly, for power efficiency, a PWM signal can be applied at the gate of N2 to switch the LED on and off without any noticeable effect.

Figure 36. Automatic LCD Panel Backlight Control

**6-BIT CONTROLLER**

The AD5227 can form a simple 6-bit controller with a clock generator, a comparator, and some output components. Figure 37 shows a generic 6-bit controller with a comparator that first compares the sampling output with the reference level and outputs either a high or low level to the AD5227  $U/\bar{D}$  pin. The AD5227 then changes step at every clock cycle in the direction indicated by the  $U/\bar{D}$  state. Although this circuit is not as elegant as the one shown in Figure 36, it is self-contained, very easy to design, and can adapt to various applications.

Figure 37. 6-Bit Controller

# AD5227

## CONSTANT BIAS WITH SUPPLY TO RETAIN RESISTANCE SETTING

Users who consider EEMEM potentiometers but cannot justify the additional cost and programming for their designs can consider constantly biasing the AD5227 with the supply to retain the resistance setting as shown in Figure 38. The AD5227 is designed specifically with low power to allow power conservation even in battery-operated systems. As shown in Figure 39, a similar low power digital potentiometer is biased with a 3.4 V 450 mA/hour Li-Ion cell phone battery. The measurement shows that the device drains negligible power. Constantly biasing the potentiometer is a practical approach because most portable devices do not require detachable batteries for charging. Although the resistance setting of the AD5227 is lost when the battery needs to be replaced, this event occurs so infrequently that the inconvenience is minimal for most applications.

# OUTLINE DIMENSIONS

\*COMPLIANT TO JEDEC STANDARDS MO-193-BA WITH THE EXCEPTION OF PACKAGE HEIGHT AND THICKNESS.

Figure 40. 8-Lead Thin Small Outline Transistor Package [TSOT] (UJ-8)  
Dimensions shown in millimeters

## ORDERING GUIDE

Model	R <sub>AB</sub> <sup>1</sup> (kΩ)	Temperature Range	Package Description	Package Option	Ordering Quantity	Branding
AD5227BUJZ10-RL7 <sup>2</sup>	10	-40°C to +105°C	8-Lead TSOT	UJ-8	3000	D3G
AD5227BUJZ10-R2 <sup>2</sup>	10	-40°C to +105°C	8-Lead TSOT	UJ-8	250	D3G
AD5227BUJZ50-RL7 <sup>2</sup>	50	-40°C to +105°C	8-Lead TSOT	UJ-8	3000	D3H
AD5227BUJZ50-R2 <sup>2</sup>	50	-40°C to +105°C	8-Lead TSOT	UJ-8	250	D3H
AD5227BUJZ100-RL7 <sup>2</sup>	100	-40°C to +105°C	8-Lead TSOT	UJ-8	3000	D3J
AD5227BUJZ100-R2 <sup>2</sup>	100	-40°C to +105°C	8-Lead TSOT	UJ-8	250	D3J
AD5227EVAL	10		Evaluation Board		1	

<sup>1</sup> The end-to-end resistance R<sub>AB</sub> is available in 10 kΩ, 50 kΩ, and 100 kΩ versions. The final three characters of the part number determine the nominal resistance value, for example, 10 kΩ = 10.

<sup>2</sup> Z = RoHS Compliant Part.
