

## FEATURES

- 2 selectable differential inputs
- 4.8 GHz operating frequency
- 75 fs rms broadband random jitter
- On-chip input terminations
- 3.3 V power supply

## APPLICATIONS

- Low jitter clock distribution
- Clock and data signal restoration
- Level translation
- Wireless communications
- Wired communications
- Medical and industrial imaging
- ATE and high performance instrumentation

## GENERAL DESCRIPTION

The ADCLK948 is an ultrafast clock fanout buffer fabricated on the Analog Devices, Inc., proprietary XFCB3 silicon germanium (SiGe) bipolar process. This device is designed for high speed applications requiring low jitter.

The device has two selectable differential inputs via the IN\_SEL control pin. Both inputs are equipped with center tapped, differential, 100  $\Omega$  on-chip termination resistors. The inputs accept dc-coupled LVPECL, CML, 3.3 V CMOS (single-ended), and ac-coupled 1.8 V CMOS, LVDS, and LVPECL inputs. A  $V_{REFX}$  pin is available for biasing ac-coupled inputs.

The ADCLK948 features eight full-swing emitter coupled logic (ECL) output drivers. For LVPECL (positive ECL) operation, bias  $V_{CC}$  to the positive supply and  $V_{EE}$  to ground. For ECL operation, bias  $V_{CC}$  to ground and  $V_{EE}$  to the negative supply.

The output stages are designed to directly drive 800 mV each side into 50  $\Omega$  terminated to  $V_{CC} - 2$  V for a total differential output swing of 1.6 V.

The ADCLK948 is available in a 32-lead LFCSP and specified for operation over the standard industrial temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ .

### ELECTRICAL CHARACTERISTICS

Typical (Typ column) values are given for  $V_{CC} - V_{EE} = 3.3\text{ V}$  and  $T_A = 25^\circ\text{C}$ , unless otherwise noted. Minimum (Min column) and maximum (Max column) values are given over the full  $V_{CC} - V_{EE} = 3.3\text{ V} \pm 10\%$  and  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$  variation, unless otherwise noted.

**Table 1. Clock Inputs and Outputs**

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
DC INPUT CHARACTERISTICS						
Input Common Mode Voltage	$V_{ICM}$	$V_{EE} + 1.5$		$V_{CC} - 0.1$	V	$\pm 1.7\text{ V}$ between input pins
Input Differential Range	$V_{ID}$	0.4		3.4	V p-p	
Input Capacitance	$C_{IN}$		0.4		pF	Open $V_T$ x

Power Supply Rejection <sup>1</sup>	$PSR_{VCC}$		<3		ps/V	$V_{CC} - V_{EE} = 3.3 \text{ V} \pm 10\%$
Output Swing Supply Rejection <sup>2</sup>	$PSR_{VCC}$		28		dB	$V_{CC} - V_{EE} = 3.3 \text{ V} \pm 10\%$

<sup>1</sup> Change in  $t_{pd}$  per change in  $V_{CC}$ .<sup>2</sup> Change in output swing per change in  $V_{CC}$ .

## ABSOLUTE MAXIMUM RATINGS

Table 5.

Parameter	Rating
Supply Voltage $V_{CC} - V_{EE}$	6V
Input Voltage CLK0, CLK1, $\overline{\text{CLK0}}$ , $\overline{\text{CLK1}}$ , IN_SEL	$V_{EE} - 0.5\text{ V}$ to $V_{CC} + 0.5\text{ V}$
CLK0, CLK1, $\overline{\text{CLK0}}$ , $\overline{\text{CLK1}}$ to $V_{T-X}$ Pin (CML, LVPECL Termination)	$\pm 40\text{ mA}$
CLK0, CLK1 to $\overline{\text{CLK0}}$ , $\overline{\text{CLK1}}$	$\pm 1.8\text{ V}$
Input Termination, $V_{T-X}$ to CLK0, CLK1, $\overline{\text{CLK0}}$ , and $\overline{\text{CLK1}}$	$\pm 2\text{ V}$
Maximum Voltage on Output Pins	$V_{CC} + 0.5\text{ V}$
Maximum Output Current	35 mA
Voltage Reference ( $V_{REF-X}$ )	$V_{CC}$ to $V_{EE}$
Operating Temperature Range	
Ambient	$-40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$
Junction	$150^{\circ}\text{C}$
Storage Temperature Range	$-65^{\circ}\text{C}$ to $+150^{\circ}\text{C}$

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## THERMAL PERFORMANCE

Table 6.

Parameter	Symbol	Description	Value <sup>1</sup>	Unit
Junction-to-Ambient Thermal Resistance	$\theta_{JA}$			
Still Air		Per JEDEC JESD51-2	49.8	$^{\circ}\text{C}/\text{W}$
0 m/sec Air Flow				
Moving Air	$\theta_{JMA}$	Per JEDEC JESD51-6	43.5	$^{\circ}\text{C}/\text{W}$
1 m/sec Air Flow			39.0	$^{\circ}\text{C}/\text{W}$
2.5 m/sec Air Flow				
Junction-to-Board Thermal Resistance	$\theta_{JB}$			
Moving Air		Per JEDEC JESD51-8	30.7	$^{\circ}\text{C}/\text{W}$
1 m/sec Air Flow				
Junction-to-Case Thermal Resistance	$\theta_{JC}$			
Moving Air		Per MIL-STD 883, Method 1012.1	8.8	$^{\circ}\text{C}/\text{W}$
Die-to-Heatsink				
Junction-to-Top-of-Package Characterization Parameter	$\Psi_{JT}$			
Still Air		Per JEDEC JESD51-2	0.7	$^{\circ}\text{C}/\text{W}$
0 m/sec Air Flow				

<sup>1</sup> Results are from simulations. The PCB is a JEDEC multilayer type. Thermal performance for actual applications requires careful inspection of the conditions in the application to determine if they are similar to those assumed in these calculations.

## DETERMINING JUNCTION TEMPERATURE

To determine the junction temperature on the application printed circuit board (PCB), use the following equation:

$$T_J = T_{CASE} + (\Psi_{JT} \times P_D)$$

where:

$T_J$  is the junction temperature ( $^{\circ}\text{C}$ ).

$T_{CASE}$  is the case temperature ( $^{\circ}\text{C}$ ) measured by the customer at the top center of the package.

$\Psi_{JT}$  is from Table 6.

$P_D$  is the power dissipation.

Values of  $\theta_{JA}$  are provided for package comparison and PCB design considerations.  $\theta_{JA}$  can be used for a first-order approximation of  $T_J$  by the equation

$$T_J = T_A + (\theta_{JA} \times P_D)$$

where  $T_A$  is the ambient temperature ( $^{\circ}\text{C}$ ).

Values of  $\theta_{JB}$  are provided in Table 6 for package comparison and PCB design considerations.

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

# FUNCTIONAL DESCRIPTION

## CLOCK INPUTS

The ADCLK948 accepts a differential clock input from one of two inputs and distributes the selected clock to all eight LVPECL outputs. The maximum specified frequency is the point at which the output voltage swing is 50% of the standard LVPECL swing (see Figure 4). See the functional block diagram (Figure 1) and the General Description section for more clock input details. See Figure 19 through Figure 23 for various clock input termination schemes.

Output jitter performance is degraded by an input slew rate below 4 V/ns, as shown in Figure 12. The ADCLK948 is specifically designed to minimize added random jitter over a wide input slew rate range. Whenever possible, clamp excessively large input signals with fast Schottky diodes because attenuators reduce the slew rate. Input signal runs of more than a few centimeters should be over low loss dielectrics or cables with good high frequency characteristics.

## CLOCK OUTPUTS

The specified performance necessitates using proper transmission line terminations. The LVPECL outputs of the ADCLK948 are designed to directly drive 800 mV into a 50 Ω cable or into microstrip/stripline transmission lines terminated with 50 Ω referenced to  $V_{CC} - 2V$ , as shown in Figure 14. The LVPECL output stage is shown in Figure 13. The outputs are designed for best transmission line matching. If high speed signals must be routed more than a centimeter, either the microstrip or the stripline technique is required to ensure proper transition times and to prevent excessive output ringing and pulse width dependent propagation delay dispersion.

Figure 13. Simplified Schematic Diagram of the LVPECL Output Stage

Figure 14 through Figure 17 depict various LVPECL output termination schemes. When dc-coupled,  $V_s$  of the receiving buffer should match  $V_{S\_DRV}$ .

Thevenin-equivalent termination uses a resistor network to provide 50 Ω termination to a dc voltage that is below  $V_{OL}$  of the LVPECL driver. In this case,  $V_{S\_DRV}$  on the ADCLK948 should equal  $V_s$  of the receiving buffer. Although the resistor combination shown (in Figure 15) results in a dc bias point of  $V_{S\_DRV} - 2V$ , the actual common-mode voltage is  $V_{S\_DRV} - 1.3V$  because there is additional current flowing from the ADCLK948 LVPECL driver through the pull-down resistor.

LVPECL Y-termination is an elegant termination scheme that uses the fewest components and offers both odd- and even-mode impedance matching. Even-mode impedance matching is an important consideration for closely coupled transmission lines at high frequencies. Its main drawback is that it offers limited flexibility for varying the drive strength of the emitter follower LVPECL driver. This can be an important consideration when driving long trace lengths but is usually not an issue.

### CLOCK INPUT SELECT (IN\_SEL) SETTINGS

A Logic 0 on the IN\_SEL pin selects the Input CLK0 and Input CLK $\bar{0}$ . A Logic 1 on the IN\_SEL pin selects Input CLK1 and Input CLK $\bar{1}$ .

### PCB LAYOUT CONSIDERATIONS

The ADCLK948 buffer is designed for very high speed applications. Consequently, high speed design techniques must be used to achieve the specified performance. It is critically important to use low impedance supply planes for both the negative supply ( $V_{EE}$ ) and the positive supply ( $V_{CC}$ ) planes as part of a multilayer board. Providing the lowest inductance return path for switching currents ensures the best possible performance in the target application.

The following references to the GND plane assume that the  $V_{EE}$  power plane is grounded for LVPECL operation. Note that, for ECL operation, the  $V_{CC}$  power plane becomes the ground plane.

It is also important to adequately bypass the input and output supplies. Place a 1  $\mu$ F electrolytic bypass capacitor within several inches of each  $V_{CC}$  power supply pin to the GND plane. In addition, place multiple high quality 0.001  $\mu$ F bypass capacitors as close as possible to each of the  $V_{CC}$  supply pins, and connect the capacitors to the GND plane with redundant vias. Carefully select high frequency bypass capacitors for minimum inductance and ESR. To improve the effectiveness of the bypass at high frequencies, minimize parasitic layout inductance. Also, avoid discontinuities along input and output transmission lines that can affect jitter performance.

In a 50  $\Omega$  environment, input and output matching have a significant impact on performance. The buffer provides internal 50  $\Omega$  termination resistors for both CLKx and CLKx inputs. Normally, the return side is connected to the reference pin that is provided. Carefully bypass the termination potential using ceramic capacitors to prevent undesired aberrations on the input signal due to parasitic inductance in the termination return path. If the inputs are dc-coupled to a source, take care to ensure that the pins are within the rated input differential and common-mode ranges.

If the return is floated, the device exhibits a 100  $\Omega$  cross termination, but the source must then control the common-mode voltage and supply the input bias currents.

There are ESD/clamp diodes between the input pins to prevent the application from developing excessive offsets to the input transistors. ESD diodes are not optimized for best ac performance. When a clamp is required, it is recommended that appropriate external diodes be used.

### Exposed Metal Paddle

The exposed metal paddle on the ADCLK948 package is both an electrical connection and a thermal enhancement. For the device to function properly, the paddle must be properly attached to the  $V_{EE}$  power plane.

When properly mounted, the ADCLK948 also dissipates heat through its exposed paddle. The PCB acts as a heat sink for the ADCLK948. The PCB attachment must provide a good thermal path to a larger heat dissipation area. This requires a grid of vias from the top layer down to the  $V_{EE}$  power plane (see Figure 18). The ADCLK948 evaluation board (ADCLK948/PCBZ) provides an example of how to attach the part to the PCB.
