DVK-2 Quick Start Guide

AND9698/D

DVK-2 Introduction

DVK-2 Base-kit

The DVK-2 is designed as quick start solution for the development of applications with AX micro-controllers and radio-chips. The DVK-2 base-kit is the development platform for applications based on the AX8052F1xx micro-controller family. With the available radio add-on-kits it becomes the ideal platform for radio performance evaluation and radio system development. The DVK-2 is compatible with AX-RadioLab and AxCode::Blocks development software for the PC.

ON Semiconductor®

www.onsemi.com

APPLICATION NOTE

Figure 1. Content of the DVK-2 BASE KIT

The DVK-2 base-kit comes with:

- 2x mainboards with radio-module connectors for one radio add-on-kit module, AX8052F100 20 MIPS ultra-low-power micro-controller, LCD display, 4 buttons, 4 LEDs, AX debug connector and battery connector for 3 AA batteries
- 1x AXDBG debug adaptor
- 1x Mini USB cable
- 1x Debug cable

DVK-2 Add-on-kits

For evaluation of AX radio ICs, a variety of add-on-kits are available. A radio add-on-kit consists of a pair of radio add-on modules and antennas. Pictured below is an example of a DVK-2 add-on module. Each add-on kit contains two modules.

AND9698/D

Figure 2. Content of the ADD5043-915-x-GEVK Kit

The following radio add-on kits are available:

- AX5045-915 add-on kit (ADD5045-915-x-GEVK)
- AX5043-915 add-on kit (ADD5043-915-x-GEVK)
- AX5043-868 add-on kit (ADD5043-868-x-GEVK)
- AX5043-433 add-on kit (ADD5043-433-x-GEVK)
- AX5043-169 add-on kit (ADD5043-169-x-GEVK)
- AX5243-868 add-on kit (ADD5243-868-x-GEVK)

- AX5051-868 add-on kit (ADD5051-868-x-GEVK)

For transmitter only evaluation the following transmitter add-on module is available

- AX5031-868 add-on kit (ADD5031-868-x-GEVK)

Getting Started With DVK-2

Upon receiving the DVK-2, the add-on modules and batteries can be connected to immediately run the pre-installed packet error rate (PER) test. (See sections “Batteries and Add-on Modules” and “Pre-installed PER Test”).

To begin configuration of the radio and application development, the following steps should be completed in order:

1. Download and install the required software for the desired combination of main board and add-on modules. (See sections “Software” till “Configuration of AxCode::Blocks”)
2. Configure AXCode::Blocks to use the SDCC compiler (See section “Configuration of AxCode::Blocks”)
3. Insert the add-on modules to the mainboard, and connect the AX debug adapter as shown in the image below. Connect the AX debug adapter to the PC. (See section “Connecting the DVK-2 to a PC”)
4. Launch AX-RadioLab or AXCode::Blocks to begin radio configuration, testing or application development

Figure 3. DVK-2 Main Board Connected to the AXDBG

Main Board Overview

A DVK-2 mainboard is the core of the DVK-2 development system. It uses an AX8052F100 as a versatile

ultra-low-power micro-controller. The mainboard is designed to evaluate AX radio ICs as well as being a platform for code development and testing.

AND9698/D

Figure 4. Details on the DVK-2 Main Board

The DVK-2 mainboard is equipped with the following components:

1. LCD display with 2 lines of 16 characters each
2. 4 power-supply jumpers:
 - a. Power for the LCD-display backlight
 - b. Power of the radio add-on module
 - c. Auxiliary power of the radio add-on module (TCXO, module recognition)
 - d. Power for the AX8052F100 micro-controller on the mainboard
3. Power supply switch (select between debug link powered and battery powered operation)
4. AX debug link connector
5. Power indicator LED
6. 4 buttons

7. Programmable LEDs
8. Arduino-compatible header footprint
9. GPIO Break-out port header footprints
10. AX8052F100 micro-controller
11. DVK-2 radio add-on module connectors

AXDBG Debug Adapter Overview

The AXDBG debug adapter is the interface between the PC and the mainboards. It can be used for programming and debugging the AX8052F1xx family of micro-controllers. It interfaces with the PC via windows drivers and the AXSDB software interface, which is then used by other AX software products. The AXSDB can also be used in mass production with the scriptable AXSDB software.

Figure 5. Details of the AXDBG Debugger

The AXDBG has the following interfaces and indicators:

1. Debug link connector
2. RJ45 Connector or legacy AX DVK systems
3. LED green indicating a program is executed on the MCU
4. LED red indicating the debug link is active, MCU in debug mode
5. Mini USB PC interface

Batteries and Add-on Modules

Batteries

Three AA batteries can be inserted on the bottom side of the DVK-2 mainboard. The orientation is indicated on the

board. The power switch toggles between battery powered and debug-link powered operation. There is no OFF position if batteries are inserted and the debug-link is connected.

Add-on Modules

One radio add-on module can be connected to the main board. The DVK-2 add-on modules have to be connected to the main board with the SMA connector facing outside.

NOTE: There is no safeguard for polarity or wrong insertion of add-on modules.

Figure 6. DVK2 Main Board with an ADD5043 RF Module Connected

Antennas

Different types of antennas can be used with the AX radio add-on modules. In addition to the antenna that ships with the kit, any 50 Ω antenna designed for a frequency matching the radio add-on module and being equipped with a male SMA connector can be used.

Software

Depending on your application and add-on-kit you need to use different ON Semiconductor AX software as listed in the Table 1 below.

Table 1.

Development Kit	Matching Software
DVK-2 base-kit, no add-on module attached	<ul style="list-style-type: none"> • AX8052IDE package <ul style="list-style-type: none"> ◆ AXCode::Blocks ◆ AXSDB ◆ LibMF ◆ SDCC
DVK-2 base-kit with AX5043, AX5243 or AX5045 (Note 1) add-on modules	<ul style="list-style-type: none"> • AX8052IDE package <ul style="list-style-type: none"> ◆ AXCode::Blocks ◆ AXSDB ◆ LibMF ◆ SDCC • AX-RadioLab
DVK-2 base-kit with AX5051 add-on module	<ul style="list-style-type: none"> • AX8052IDE package <ul style="list-style-type: none"> ◆ AXCode::Blocks ◆ AXSDB ◆ LibMF ◆ SDCC • AXGen2-RadioLab
DVK-2 base-kit with AX5031 (Note 2) add-on module	<ul style="list-style-type: none"> • AX8052IDE package <ul style="list-style-type: none"> ◆ AXCode::Blocks ◆ AXSDB ◆ LibMF ◆ SDCC • AX-ParamCalc

1. The AX5045 requires AXCodeBlocks V1.27 (or greater) and AX-RadioLab V2.11a (or greater).
 2. The AX5031 add-on module is a transmitter only and does not work on a mainboard programmed as a receiver.

Software Installation

First, download the required software packages (specified in the previous section) from the ON Semiconductor Wireless Transceivers software page:

<http://www.onsemi.com/PowerSolutions/supportDoc.do?type=software&category=16860>

The default location for AX–RadioLab, AxCode::Blocks and AXSDB is in the C:\Program Files (x86)\ON Semiconductor (or C:\Program Files (x86)\AXSEM for AXGen2–RadioLAB and AXParamCalc). LibMF and the supporting libraries are installed in the AXSDB directory. The SDCC C–compiler is typically installed directly into the C:\Program Files directory. Please check the respective documentations for further detail.

AX–IDE for AX5043, AX5243 and AX5045:

After unzipping the downloaded package, execute the AXIDE–setup–1.27.exe to start the installation of the multiple tools included in the AX–IDE such as AX–RadioLAB and AxCode::Blocks.

NOTE: The installer requests to reboot the computer, but is not necessary.

AX8052–IDE for AX5051 and AX5031:

Important Note: AX–RadioLAB uses the AX8052–IDE software package in the background. Therefore the AX8052–IDE software package has to be installed and configured before installation of the other software. Otherwise you may experience difficulties in installing the driver later.

NOTE: The installer requests to reboot the computer, but is not necessary.

After downloading, each package will need to be unzipped. Each package contains a windows installer executable, which needs administrator privileges to be run. Run the installer for the AX8052–IDE package first. It installs the AxCode::Blocks IDE, the SDCC C–compiler, the LibMF support libraries, the AXSDB command line debugger and low level drivers. Repeat the same process for AXGen2–RadioLab, or AX–ParamCalc, depending on the add–on module. (See Table 1 in previous section).

NOTE: The installer requests to reboot the computer, but is not necessary.

Configuration of AxCode::Blocks

After starting AxCode::Blocks for the first time, the user has to select SDCC as the default compiler. The following

window will pop-up. After this configuration process you are ready to go.

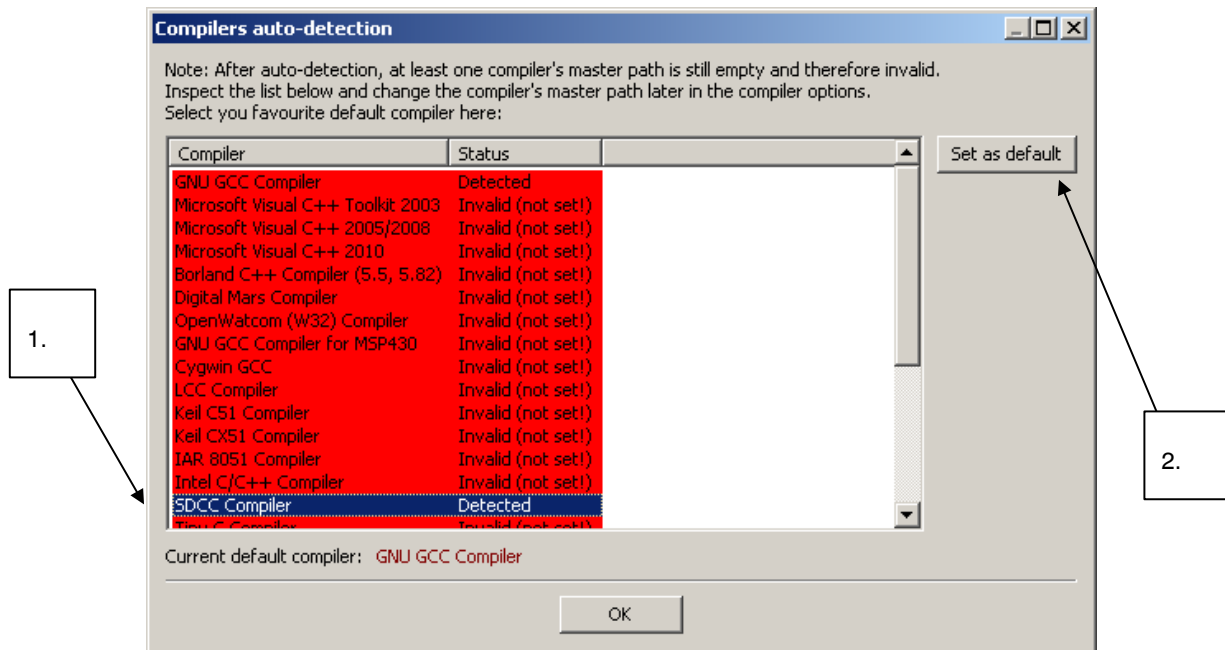

Figure 7.

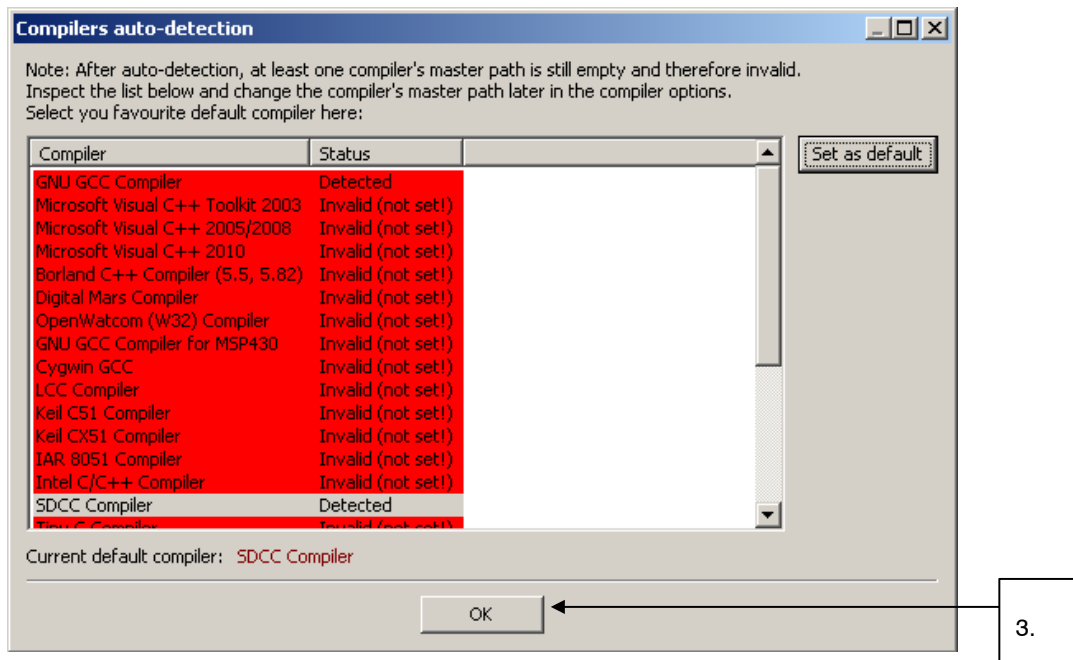

Figure 8.

Connecting the DVK-2 to a PC

- Step 1: Verify the proper software is installed and configured, as detailed in the previous sections.
- Step 2: Connect the AXDBG via the USB cable to the computer. Since the driver is already installed, the

computer should report 2 “USB Serial Converters” as well as a “USB Serial Port” in your Device Manager.

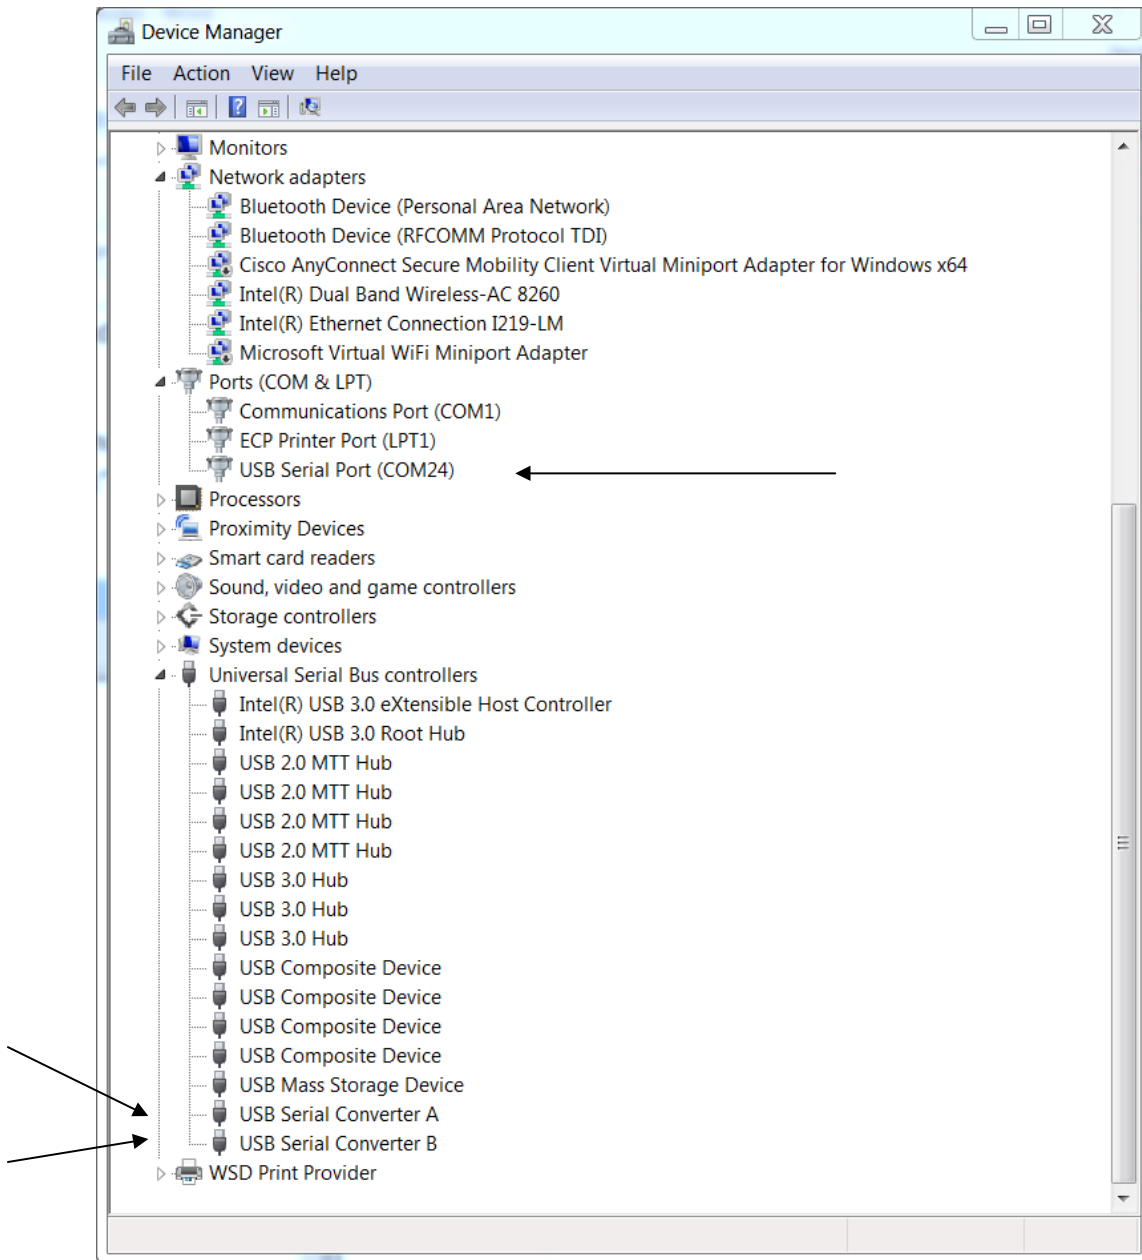

Figure 9.

- Step 3: Connect a DVK-2 mainboard via the debug cable to the AXDBG debug adapter.

Pre-installed PER Test

The DVK-2 mainboards come with a pre-installed software for tests with DVK-2 radio add-on modules. The pre-installed software recognizes most AX radio add-on modules and automatically starts testing packet error rate. One DVK-2 mainboard is programmed to be a transmitter and the other to be a receiver. After inserting batteries, attach radio add-on modules and set the power supply switch to battery. For longer range, use antennas. The transmitter indicates the number of the last transmitted packet, while the receiver indicates the packet error rate (PER), the RSSI and the frequency offset.

The pre-installed software is the same as the default master/slave application that can be configured in AX-RadioLab. See the following sections for details on how to use AX-RadioLab to configure this application.

Transmitter

The transmitter sends a standard packet every second.

The LCD display shows:

MASTER

TX 0051 (the last transmitted packet number)

Transmit parameter:

868.3 MHz

100 kbps

max power

FSK, deviation h = 0.5

duty cycle ~ 1 s

Receiver

The application on the AX8052F100 receives the data packets from the transmitter and shows packet error rate, signal strength and frequency offset.

The LCD display shows:

P:0014 O:00397

L:0000 R: -034

P is the number of received packets

L is the number of lost packets

O is the frequency offset in Hz

R is the receiver strength indicator (RSSI) in dBm

NOTES: The receiver screen updates only if a valid packet was received.

If the transmitter is reset during the test, the P and L values become invalid.

Working With AX-RadioLab

AX-RadioLab is the most advanced development tool for SDR radio applications. It offers a variety of transmitter and receiver options such as

- Periodic transmission of packets timed with the RC oscillator of the AX5043
- Periodic transmission of packets timed with the 32 kHz XTAL oscillator of the MCU
- Transmit on push-button
- Wake-on-radio reception with programmable wake-up interval
- Synchronous transmit and receive with programmable wake-up interval
- Optional acknowledge package send for all modes

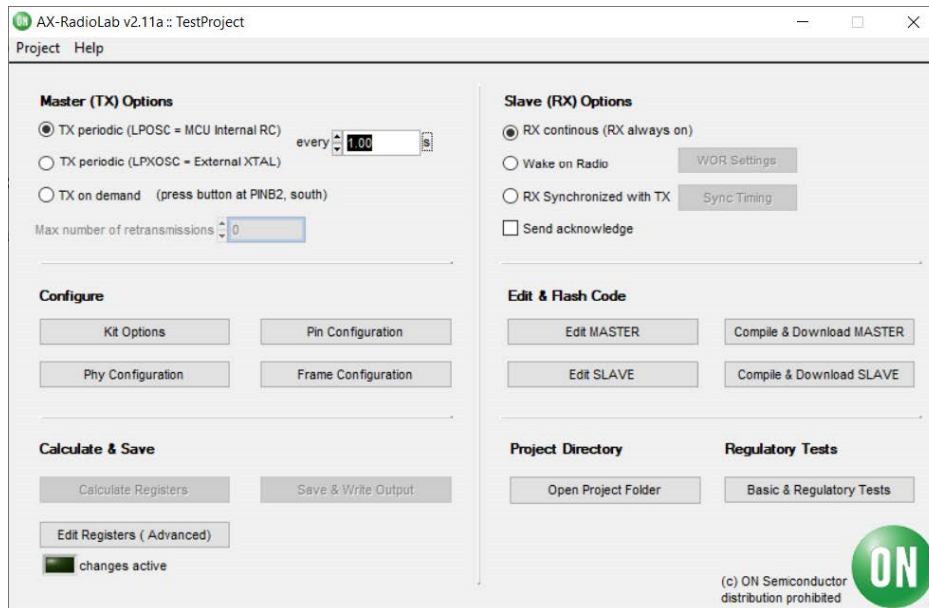

Figure 10. Screenshot of AX-RadioLab Main Panel GUI

Additionally, AX-RadioLab allows the user to configure the packet format, as well as PHY parameters.

Since AX–RadioLab is a source code generator, the developer can use the generated C code example project as a robust foundation upon which to build the end application.

AX–RadioLab also estimates the power consumption of the radio device. For most modes the AX8052F100 power consumption is negligible. Average and peak currents are indicated for transmitter and receiver.

Additional documentation for AX–RadioLab can be found on the AX5043 product page.

(<http://www.onsemi.com/PowerSolutions/product.do?id=AX5043>)

NOTE: AX–RadioLab is designed for use only with the AX5043, AX5243 and AX5045 based radio applications. For AX5051–based applications, see AXGen2–RadioLab, available on the AX5051 product page.
(<http://www.onsemi.com/PowerSolutions/product.do?id=AX5051-1-TA05>)

Working With AxCode::Blocks

AxCode::Blocks is the graphical IDE for code development on AX micro–controllers. It enables the developer to access all the debugging features of the AX micro–controllers, in particular:

- Unlimited (limited only by memory size) number of break points
- Access to all AX8052F1xx MCU registers as well as to all AX radio chip registers
- Debug link UART in a window for debugging printf–style without the need of extra hardware
- SDCC C–compiler pre–installed and ready to go

Additional documentation for AxCode::Blocks can be found on the AX8052F100 product page.

(<http://www.onsemi.com/PowerSolutions/product.do?id=AX8052F100>)

Interaction Between Development Tools

Figure 11.

The AX8052–IDE–setup.exe contains all tools for developing and debugging C source code applications for the AX8052F1xx family of micro–controllers.

The AX–RadioLab GUI is a code generator, which configures C code, which can then be compiled and

downloaded directly from the AX–RadioLab or it can be edited, modified and debugged in the AxCode::Blocks IDE.

The user normally starts in the AX–RadioLab GUI, which generates all necessary configuration and program files. The project can optionally be viewed and modified in
