

Dual, 3 V, CMOS, LVDS Differential Line Receiver

ADN4664

FEATURES

±15 kV ESD protection on output pins 400 Mbps (200 MHz) switching rates Flow-through pinout simplifies PCB layout 100 ps channel-to-channel skew (typical) 2.5 ns maximum propagation delay 3.3 V power supply High impedance outputs on power-down Low power design: typically 3 mW (quiescent) Interoperable with existing 5 V LVDS drivers Accepts small swing (310 mV typical) differential signal levels Supports open, short, and terminated input fail-safe 0 V to -100 mV threshold region Conforms to TIA/EIA-644 LVDS standard Industrial operating temperature range: -40°C to +85°C

Available in surface-mount (SOIC) package

APPLICATIONS

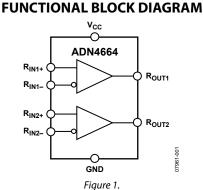

Point-to-point data transmission Multidrop buses Clock distribution networks Backplane receivers

GENERAL DESCRIPTION

The ADN4664 is a dual, CMOS, low voltage differential signaling (LVDS) line receiver offering data rates of over 400 Mbps (200 MHz) and ultralow power consumption. It features a flow-through pinout for easy PCB layout and separation of input and output signals.

The device accepts low voltage (310 mV typical) differential input signals and converts them to a single-ended 3 V TTL/ CMOS logic level.

The ADN4664 and its companion driver, the ADN4663, offer a new solution to high speed, point-to-point data transmission, and a low power alternative to emitter-coupled logic (ECL) or positive emitter-coupled logic (PECL).

REVISION HISTORY

1/09—Revision 0: Initial Version

SPECIFICATIONS

 V_{DD} = 3.0 V to 3.6 V; C_{L} = 15 pF to GND; all specifications T_{MIN} to $T_{\text{MAX}},$ unless otherwise noted.

Table 1.

Parameter ¹	Symbol	Min	Typ ²	Max	Unit	Conditions/Comments
LVDS INPUT						
High Threshold at R _{INx+} , R _{INx-} 3	V _{TH}			+100	mV	V _{CM} = 1.2 V, 0.05 V, 2.95 V
Low Threshold at R _{INx+} , R _{INx-} ³	V _{TL}	-100			mV	V _{CM} = 1.2 V, 0.05 V, 2.95 V
Input Current at R _{INx+} , R _{INx-}	lin	-10	±1	+10	μΑ	$V_{IN} = 2.8 V$, $V_{CC} = 3.6 V$ or $0 V$
		-10	±1	+10	μΑ	$V_{IN} = 0 V$, $V_{CC} = 3.6 V$ or $0 V$
		-20	±1	+20	μΑ	$V_{IN} = 3.6 V, V_{CC} = 0 V$
OUTPUT						
Output High Voltage	V _{OH}	2.7	3.1		V	$I_{OH} = -0.4 \text{ mA}, V_{ID} = +200 \text{ mV}$
		2.7	3.1		V	$I_{OH} = -0.4 \text{ mA}$, input terminated
		2.7	3.1		V	$I_{OH} = -0.4 \text{ mA}$, input shorted
Output Low Voltage	Vol		0.3	0.5	V	$I_{OL} = 2 \text{ mA}, V_{ID} = -200 \text{ mV}$
Output Short-Circuit Current ⁴	los	-15	-47	-100	mA	Enabled, $V_{OUT} = 0 V$
Input Clamp Voltage	V _{CL}	-1.5	-0.8		V	$I_{CL} = -18 \text{ mA}$
POWER SUPPLY						
No Load Supply Current	lcc		5.4	9	mA	Inputs open
ESD PROTECTION						
R _{INx+} , R _{INx-} Pins			±15 kV			Human body model
All Pins Except R _{INx+} , R _{INx-}			±4 kV			Human body model

¹ Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground unless otherwise specified. ² All typicals are given for: $V_{CC} = 3.3 \text{ V}$, $T_A = 25^{\circ}\text{C}$. ³ V_{CC} is always higher than R_{INX+} and R_{INX+} and R_{INX+} are allowed to have a voltage range of -0.2 V to $V_{CC} - V_{ID}/2$. However, to be compliant with ac

specifications, the common voltage range is 0.1 V to 2.3 V.

⁴ Output short-circuit current (los) is specified as magnitude only; the minus sign indicates direction only. Only one output should be shorted at a time. Do not exceed maximum junction temperature specification.

AC CHARACTERISTICS

 V_{DD} = 3.0 V to 3.6 V; $C_{\text{L}^{1}}$ = 15 pF to GND; all specifications T_{MIN} to T_{MAX} , unless otherwise noted.

Table 2.

Parameter	Symbol	Min	Typ ²	Max	Unit	Conditions/Comments ³
Differential Propagation Delay High to Low	t _{PHLD}	1.0	2.15	2.5	ns	$C_L = 15 \text{ pF}, V_{ID} = 200 \text{ mV}$ (see Figure 2 and Figure 3)
Differential Propagation Delay Low to High	t PLHD	1.0	2.03	2.5	ns	$C_L = 15 \text{ pF}, V_{ID} = 200 \text{ mV}$ (see Figure 2 and Figure 3)
Differential Pulse Skew $ t_{PHLD} - t_{PLHD} ^4$	t _{SKD1}	0	80	400	ps	$C_L = 15 \text{ pF}, V_{ID} = 200 \text{ mV}$ (see Figure 2 and Figure 3)
Differential Channel-to-Channel Skew (Same Device)⁵	t _{skD2}	0	100	500	ps	C_L = 15 pF, $V_{\rm ID}$ = 200 mV (see Figure 2 and Figure 3)
Differential Part-to-Part Skew ⁶	t _{SKD3}			1.0	ns	$C_L = 15 \text{ pF}, V_{ID} = 200 \text{ mV}$ (see Figure 2 and Figure 3)
Differential Part-to-Part Skew ⁷	t _{SKD4}			1.5	ns	$C_L = 15 \text{ pF}, V_{ID} = 200 \text{ mV}$ (see Figure 2 and Figure 3)
Rise Time	t _{TLH}		510	800	ps	$C_L = 15 \text{ pF}, V_{ID} = 200 \text{ mV}$ (see Figure 2 and Figure 3)
Fall Time	t _{THL}		445	800	ps	$C_L = 15 \text{ pF}, V_{ID} = 200 \text{ mV}$ (see Figure 2 and Figure 3)
Maximum Operating Frequency ⁸	f _{MAX}	200	250		MHz	All channels switching

 1 C $_{\text{L}}$ includes probe and jig capacitance.

² All typicals are given for $V_{CC} = 3.3 \text{ V}$, $T_A = 25^{\circ}\text{C}$.

 3 Generator waveform for all tests unless otherwise specified: f = 1 MHz, Z₀ = 50 Ω , t_{TLH} and t_{THL} (0% to 100%) \leq 3 ns for R_{INx+}, R_{INx-}

⁴ t_{SKD1} is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel. ⁵ Channel-to-channel skew, t_{SKD2}, is the defined as the difference between the propagation delay of one channel and the propagation delay of the other channel on the

same chip with any event on the inputs.

⁶ t_{SKD3}, part-to-part skew, is the differential channel-to-channel skew of any event between devices. This specification applies to devices at the same V_{CC} and within 5°C of each other within the operating temperature range.

7 tsx04, part-to-part skew, is the differential channel-to-channel skew of any event between devices. This specification applies to devices over recommended operating temperature and voltage ranges, and across process distribution. t_{skD4} is defined as |maximum – minimum| differential propagation delay. ⁸ f_{MAX} generator input conditions: f = 200 MHz, $t_{TLH} = t_{THL} < 1$ ns (0% to 100%), 50% duty cycle, differential (1.05 V to 1.35 V peak-to-peak). Output criteria: 60%/40% duty

cycle, Vol (maximum 0.4 V), VoH (minimum 2.7 V), load = 15 pF (stray plus probes).

ABSOLUTE MAXIMUM RATINGS

 $T_A = 25^{\circ}C$, unless otherwise noted.

Table 3.

Parameter	Rating
V _{cc} to GND	–0.3 V to +4 V
Input Voltage (R _{INx+} , R _{INx} -) to GND	-0.3 V to V _{CC} + 3.9 V
Output Voltage (Routx) to GND	-0.3 V to V _{CC} + 0.3 V
Operating Temperature Range	
Industrial Temperature Range	-40°C to +85°C
Storage Temperature Range	–65°C to +150°C
Junction Temperature (TJ max)	150°C
Power Dissipation	$(T_J max - T_A)/\theta_{JA}$
SOIC Package	
θ_{JA} Thermal Impedance	149.5°C/W
Reflow Soldering Peak Temperature	
Pb-Free	260°C ± 5°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

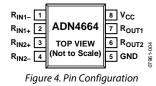

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	R _{IN1-}	Receiver Channel 1 Inverting Input. When this input is more negative than R _{IN1+} , R _{OUT1} is high. When this input is more positive than R _{IN1+} , R _{OUT1} is low.
2	R _{IN1+}	Receiver Channel 1 Noninverting Input. When this input is more positive than R _{IN1-} , R _{OUT1} is high. When this input is more negative than R _{IN1-} , R _{OUT1} is low.
3	R _{IN2+}	Receiver Channel 2 Noninverting Input. When this input is more positive than RIN2-, ROUT2 is high. When this input is more negative than RIN2-, ROUT2 is low.
4	R _{IN2-}	Receiver Channel 2 Inverting Input. When this input is more negative than R _{IN2+} , R _{OUT2} is high. When this input is more positive than R _{IN2+} , R _{OUT2} is low.
5	GND	Ground reference point for all circuitry on the part.
6	R _{OUT2}	Receiver Channel 2 Output (3 V TTL/CMOS). If the differential input voltage between R _{IN2+} and R _{IN2-} is positive, this output is high. If the differential input voltage is negative, this output is low.
7	R _{OUT1}	Receiver Channel 1 Output (3 V TTL/CMOS). If the differential input voltage between R _{IN1+} and R _{IN-} is positive, this output is high. If the differential input voltage is negative, this output is low.
8	Vcc	Power Supply Input. This part can be operated from 3.0 V to 3.6 V.

THEORY OF OPERATION

The ADN4664 is a dual line receiver for low voltage differential signaling. It takes a differential input signal of 310 mV typically and converts it into a single-ended 3 V TTL/CMOS logic signal.

A differential current input signal, received via a transmission medium, such as a twisted pair cable, develops a voltage across a terminating resistor, R_T . This resistor is chosen to match the characteristic impedance of the medium, typically around 100 Ω . The differential voltage is detected by the receiver and converted back into a single-ended logic signal.

When the noninverting receiver input, R_{INx+} , is positive with respect to the inverting input R_{INx-} (current flows through R_T from R_{INx+} to R_{INx-}), then R_{OUTx} is high. When the noninverting receiver input R_{INx+} is negative with respect to the inverting input R_{INx-} (current flows through R_T from R_{INx-} to R_{INx+}), then R_{OUTx} is low.

The ADN4664 differential line receiver is capable of receiving signals of 100 mV over a ± 1 V common-mode range centered around 1.2 V. This relates to the typical driver offset voltage value of 1.2 V. The signal originating from the driver is centered around 1.2 V and may shift ± 1 V around this center point. This ± 1 V shifting may be caused by a difference in the ground potential of the driver and receiver, the common-mode effect of coupled noise, or both.

Using the ADN4663 as a driver, the received differential current is between 2.5 mA and 4.5 mA (typically 3.1 mA), developing between 250 mV and 450 mV across a 100 Ω termination resistor. The received voltage is centered around the receiver offset of 1.2 V. In other words, the noninverting receiver input is typically (1.2 V + [310 mV/2]) = 1.355 V, and the inverting receiver input is

 $(1.2 \ V - [310 \ mV/2]) = 1.045 \ V \ for \ Logic \ 1. \ For \ Logic \ 0 \ the \ inverting \ and \ noninverting \ input \ voltages \ are \ reversed. \ Note \ that \ because \ the \ differential \ voltage \ reverses \ polarity, \ the \ peak-to-peak \ voltage \ swing \ across \ R_T \ is \ twice \ the \ differential \ voltage.$

Current mode signaling offers considerable advantages over voltage mode signalling, such as RS-422. The operating current remains fairly constant with increased switching frequency, whereas with voltage mode drivers the current increases exponentially in most cases. This is caused by the overlap as internal gates switch between high and low, which causes currents to flow from V_{CC} to ground. A current mode device simply reverses a constant current between its two outputs, with no significant overlap currents.

This is similar to emitter-coupled logic (ECL) and positive emittercoupled logic (PECL), but without the high quiescent current of ECL and PECL.

APPLICATIONS INFORMATION

Figure 23 shows a typical application for point-to-point data transmission using the ADN4663 as the driver.
