

IGLOO PLUS Low Power Flash FPGAs

with Flash*Freeze Technology

Features and Benefits

Low Power

- 1.2 V to 1.5 V Core Voltage Support for Low Power
- Supports Single-Voltage System Operation
- 5 μ W Power Consumption in Flash*Freeze Mode
- Low Power Active FPGA Operation
- Flash*Freeze Technology Enables Ultra-Low Power Consumption while Maintaining FPGA Content
- Configurable Hold Previous State, Tristate, HIGH, or LOW State per I/O in Flash*Freeze Mode
- Easy Entry To / Exit From Ultra-Low Power Flash*Freeze Mode

Feature Rich

- 30 k to 125 k System Gates
- Up to 36 kbits of True Dual-Port SRAM
- Up to 212 User I/Os

Reprogrammable Flash Technology

- 130-nm, 7-Layer Metal, Flash-Based CMOS Process
- Instant On Level 0 Support
- Single-Chip Solution
- Retains Programmed Design When Powered Off
- 250 MHz (1.5 V systems) and 160 MHz (1.2 V systems) System Performance

In-System Programming (ISP) and Security

- ISP Using On-Chip 128-Bit Advanced Encryption Standard (AES) Decryption via JTAG (IEEE 1532-compliant)[†]
- FlashLock[®] Designed to Secure FPGA Contents

High-Performance Routing Hierarchy

- Segmented, Hierarchical Routing and Clock Structure

Advanced I/O

- 1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V Mixed-Voltage Operation
- Bank-Selectable I/O Voltages—4 Banks per Chip on All IGLOO[®] PLUS Devices
- Single-Ended I/O Standards: LVTTTL, LVCMOS 3.3 V / 2.5 V / 1.8 V / 1.5 V / 1.2 V
- Selectable Schmitt Trigger Inputs
- Wide Range Power Supply Voltage Support per JESD8-B, Allowing I/Os to Operate from 2.7 V to 3.6 V
- Wide Range Power Supply Voltage Support per JESD8-12, Allowing I/Os to Operate from 1.14 V to 1.575 V
- I/O Registers on Input, Output, and Enable Paths
- Hot-Swappable and Cold-Sparing I/Os
- Programmable Output Slew Rate and Drive Strength
- Weak Pull-Up/Down
- IEEE 1149.1 (JTAG) Boundary Scan Test
- Pin-Compatible Small-Footprint Packages across the IGLOO PLUS Family

Clock Conditioning Circuit (CCC) and PLL[†]

- Six CCC Blocks, One with an Integrated PLL
- Configurable Phase Shift, Multiply/Divide, Delay Capabilities, and External Feedback
- Wide Input Frequency Range (1.5 MHz up to 250 MHz)

Embedded Memory

- 1 kbit of FlashROM User Nonvolatile Memory
- SRAMs and FIFOs with Variable-Aspect-Ratio 4,608-Bit RAM Blocks ($\times 1$, $\times 2$, $\times 4$, $\times 9$, and $\times 18$ organizations)[†]
- True Dual-Port SRAM (except $\times 18$)[†]

1 – IGLOO PLUS Device Family Overview

General Description

The IGLOO PLUS family of flash FPGAs, based on a 130 nm flash process, offers the lowest power FPGA, a single-chip solution, small-footprint packages, reprogrammability, and an abundance of advanced features.

The Flash*Freeze technology used in IGLOO PLUS devices enables entering and exiting an ultra-low power mode that consumes as little as 5 μ W while retaining the design information, SRAM content, registers, and I/O states. Flash*Freeze technology simplifies power management through I/O and clock management with rapid recovery to operation mode.

The Low Power Active capability (static idle) allows for ultra-low power consumption while the IGLOO PLUS device is completely functional in the system. This allows the IGLOO PLUS device to control system power management based on external inputs (e.g., scanning for keyboard stimulus) while consuming minimal power.

Nonvolatile flash technology gives IGLOO PLUS devices the advantage of being a secure, low power, single-chip solution that is Instant On. IGLOO PLUS is reprogrammable and offers time-to-market benefits at an ASIC-level unit cost.

These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

IGLOO PLUS devices offer 1 kbit of on-chip, reprogrammable, nonvolatile FlashROM storage as well as clock conditioning circuitry based on an integrated phase-locked loop (PLL). IGLOO PLUS devices have up to 125 k system gates, supported with up to 36 kbits of true dual-port SRAM and up to 212 user I/Os. The AGLP030 devices have no PLL or RAM support.

Flash*Freeze Technology

The IGLOO PLUS device offers unique Flash*Freeze technology, allowing the device to enter and exit ultra-low power Flash*Freeze mode. IGLOO PLUS devices do not need additional components to turn off I/Os or clocks while retaining the design information, SRAM content, registers, and I/O states. Flash*Freeze technology is combined with in-system programmability, which enables users to quickly and easily upgrade and update their designs in the final stages of manufacturing or in the field. The ability of IGLOO PLUS V2 devices to support a wide range of core and I/O voltages (1.2 V to 1.5 V) allows further reduction in power consumption, thus achieving the lowest total system power.

During Flash*Freeze mode, each I/O can be set to the following configurations: hold previous state, tristate, or set as HIGH or LOW.

The availability of low power modes, combined with reprogrammability, a single-chip and single-voltage solution, and availability of small-footprint, high-pin-count packages, make IGLOO PLUS devices the best fit for portable electronics.

Flash Advantages

Low Power

IGLOO PLUS devices exhibit power characteristics similar to those of an ASIC, making them an ideal choice for power-sensitive applications. IGLOO PLUS devices have only a very limited power-on current surge and no high-current transition period, both of which occur on many FPGAs.

IGLOO PLUS devices also have low dynamic power consumption to further maximize power savings; power is even further reduced by the use of a 1.2 V core voltage.

Low dynamic power consumption, combined with low static power consumption and Flash*Freeze technology, gives the IGLOO PLUS device the lowest total system power offered by any FPGA.

Security

Nonvolatile, flash-based IGLOO PLUS devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. IGLOO PLUS devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

IGLOO PLUS devices (except AGLP030) utilize a 128-bit flash-based lock and a separate AES key to provide the highest level of security in the FPGA industry for programmed intellectual property and configuration data. In addition, all FlashROM data in IGLOO PLUS devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. AES was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. IGLOO PLUS devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. IGLOO PLUS devices with AES-based security provide a high level of protection for secure, remote field updates over public networks such as the Internet, and ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves.

Security, built into the FPGA fabric, is an inherent component of the IGLOO PLUS family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The IGLOO PLUS family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks. Your valuable IP is protected with industry-standard security, making remote ISP possible. An IGLOO PLUS device provides the best available security for programmable logic designs.

Single Chip

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based IGLOO PLUS FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

The IGLOO PLUS devices can be operated with a 1.2 V or 1.5 V single-voltage supply for core and I/Os, eliminating the need for additional supplies while minimizing total power consumption.

Instant On

Flash-based IGLOO PLUS devices support Level 0 of the Instant On classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The Instant On feature of flash-based IGLOO PLUS devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and clock generation PLLs. In addition, glitches and brownouts in system power will not corrupt the IGLOO PLUS device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based IGLOO PLUS devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

IGLOO PLUS flash FPGAs allow the user to quickly enter and exit Flash*Freeze mode. This is done almost instantly (within 1 μ s), and the device retains configuration and data in registers and RAM. Unlike SRAM-based FPGAs, the device does not need to reload configuration and design state from external memory components; instead, it retains all necessary information to resume operation immediately.

Reduced Cost of Ownership

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, flash-based IGLOO PLUS devices allow all functionality to be Instant On; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote in-system reprogramming to support future design iterations and field upgrades with confidence that valuable intellectual property cannot be compromised or copied. Secure ISP can be performed using the industry-standard AES algorithm.

The IGLOO PLUS family device architecture mitigates the need for ASIC migration at higher user volumes. This makes the IGLOO PLUS family a cost-effective ASIC replacement solution, especially for applications in the consumer, networking/communications, computing, and avionics markets.

Firm-Error Immunity

Firm errors occur most commonly when high-energy neutrons, generated in the upper atmosphere, strike a configuration cell of an SRAM FPGA. The energy of the collision can change the state of the configuration cell and thus change the logic, routing, or I/O behavior in an unpredictable way. These errors are impossible to prevent in SRAM FPGAs. The consequence of this type of error can be a complete system failure. Firm errors do not exist in the configuration memory of IGLOO PLUS flash-based FPGAs. Once it is programmed, the flash cell configuration element of IGLOO PLUS FPGAs cannot be altered by high-energy neutrons and is therefore immune to them. Recoverable (or soft) errors occur in the user data SRAM of all FPGA devices. These can easily be mitigated by using error detection and correction (EDAC) circuitry built into the FPGA fabric.

Advanced Flash Technology

The IGLOO PLUS family offers many benefits, including nonvolatility and reprogrammability, through an advanced flash-based, 130 nm LVCMOS process with seven layers of metal. Standard CMOS design techniques are used to implement logic and control functions. The combination of fine granularity, enhanced flexible routing resources, and abundant flash switches allows for very high logic utilization without compromising device routability or performance. Logic functions within the device are interconnected through a four-level routing hierarchy.

IGLOO PLUS family FPGAs utilize design and process techniques to minimize power consumption in all modes of operation.

Advanced Architecture

The proprietary IGLOO PLUS architecture provides granularity comparable to standard-cell ASICs. The IGLOO PLUS device consists of five distinct and programmable architectural features ([Figure 1-1 on page 1-4](#)):

- Flash*Freeze technology
- FPGA VersaTiles
- Dedicated FlashROM
- Dedicated SRAM/FIFO memory[†]
- Extensive CCCs and PLLs[†]
- Advanced I/O structure

The FPGA core consists of a sea of VersaTiles. Each VersaTile can be configured as a three-input logic function, a D-flip-flop (with or without enable), or a latch by programming the appropriate flash switch interconnections. The versatility of the IGLOO PLUS core tile as either a three-input lookup table (LUT) equivalent or a D-flip-flop/latch with enable allows for efficient use of the FPGA fabric. The VersaTile capability is unique to the ProASIC® family of third-generation-architecture flash FPGAs. VersaTiles are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.

[†] The AGLP030 device does not support PLL or SRAM.

Note: *Not supported by AGLP030 devices

Figure 1-1 • IGLOO PLUS Device Architecture Overview with Four I/O Banks (AGLP030, AGLP060, and AGLP125)

Flash*Freeze Technology

The IGLOO PLUS device has an ultra-low power static mode, called Flash*Freeze mode, which retains all SRAM and register information and can still quickly return to normal operation. Flash*Freeze technology enables the user to quickly (within 1 μ s) enter and exit Flash*Freeze mode by activating the Flash*Freeze pin while all power supplies are kept at their original values. In addition, I/Os and global I/Os can still be driven and can be toggling without impact on power consumption, clocks can still be driven or can be toggling without impact on power consumption, and the device retains all core registers, SRAM information, and I/O states. I/Os can be individually configured to either hold their previous state or be tristated during Flash*Freeze mode. Alternatively, they can be set to a certain state using weak pull-up or pull-down I/O attribute configuration. No power is consumed by the I/O banks, clocks, JTAG pins, or PLL, and the device consumes as little as 5 μ W in this mode.

Flash*Freeze technology allows the user to switch to Active mode on demand, thus simplifying the power management of the device.

The Flash*Freeze pin (active low) can be routed internally to the core to allow the user's logic to decide when it is safe to transition to this mode. Refer to Figure 1-2 for an illustration of entering/exiting Flash*Freeze mode. It is also possible to use the Flash*Freeze pin as a regular I/O if Flash*Freeze mode usage is not planned.

Figure 1-2 • IGLOO PLUS Flash*Freeze Mode

VersaTiles

The IGLOO PLUS core consists of VersaTiles, which have been enhanced beyond the ProASIC^{PLUS}® core tiles. The IGLOO PLUS VersaTile supports the following:

- All 3-input logic functions—LUT-3 equivalent
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set

Refer to [Figure 1-3](#) for VersaTile configurations.

Figure 1-3 • VersaTile Configurations

User Nonvolatile FlashROM

IGLOO PLUS devices have 1 kbit of on-chip, user-accessible, nonvolatile FlashROM. The FlashROM can be used in diverse system applications:

- Internet protocol addressing (wireless or fixed)
- System calibration settings
- Device serialization and/or inventory control
- Subscription-based business models (for example, set-top boxes)
- Secure key storage for secure communications algorithms
- Asset management/tracking
- Date stamping
- Version management

The FlashROM is written using the standard IGLOO PLUS IEEE 1532 JTAG programming interface. The core can be individually programmed (erased and written), and on-chip AES decryption can be used selectively to securely load data over public networks (except in AGLP030 devices), as in security keys stored in the FlashROM for a user design.

The FlashROM can be programmed via the JTAG programming interface, and its contents can be read back either through the JTAG programming interface or via direct FPGA core addressing. Note that the FlashROM can only be programmed from the JTAG interface and cannot be programmed from the internal logic array.

The FlashROM is programmed as 8 banks of 128 bits; however, reading is performed on a byte-by-byte basis using a synchronous interface. A 7-bit address from the FPGA core defines which of the 8 banks and which of the 16 bytes within that bank are being read. The three most significant bits (MSBs) of the FlashROM address determine the bank, and the four least significant bits (LSBs) of the FlashROM address define the byte.

The IGLOO PLUS development software solutions, Libero[®] System-on-Chip (SoC) and Designer, have extensive support for the FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature allows the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using Libero SoC and Designer software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

SRAM and FIFO

IGLOO PLUS devices (except AGLP030 devices) have embedded SRAM blocks along their north side. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be sent through a 4-bit port and read as a single bitstream. The embedded SRAM blocks can be initialized via the device JTAG port (ROM emulation mode) using the UJTAG macro (except in AGLP030 devices).

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal Empty and Full flags. The embedded FIFO control unit contains the counters necessary for generation of the read and write address pointers. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

PLL and CCC

IGLOO PLUS devices provide designers with very flexible clock conditioning circuit (CCC) capabilities. Each member of the IGLOO PLUS family contains six CCCs. One CCC (center west side) has a PLL. The AGLP030 device does not have a PLL or CCCs; it contains only inputs to six globals.

The six CCC blocks are located at the four corners and the centers of the east and west sides. One CCC (center west side) has a PLL.

The four corner CCCs and the east CCC allow simple clock delay operations as well as clock spine access.

The inputs of the six CCC blocks are accessible from the FPGA core or from one of several inputs located near the CCC that have dedicated connections to the CCC block.

The CCC block has these key features:

- Wide input frequency range (f_{IN_CCC}) = 1.5 MHz up to 250 MHz
- Output frequency range (f_{OUT_CCC}) = 0.75 MHz up to 250 MHz
- 2 programmable delay types for clock skew minimization
- Clock frequency synthesis (for PLL only)

Additional CCC specifications:

- Internal phase shift = 0°, 90°, 180°, and 270°. Output phase shift depends on the output divider configuration (for PLL only).
- Output duty cycle = 50% ± 1.5% or better (for PLL only)
- Low output jitter: worst case < 2.5% × clock period peak-to-peak period jitter when single global network used (for PLL only)
- Maximum acquisition time is 300 μs (for PLL only)
- Exceptional tolerance to input period jitter—allowable input jitter is up to 1.5 ns (for PLL only)
- Four precise phases; maximum misalignment between adjacent phases (for PLL only) is 40 ps × 250 MHz / f_{OUT_CCC}

Global Clocking

IGLOO PLUS devices have extensive support for multiple clocking domains. In addition to the CCC and PLL support described above, there is a comprehensive global clock distribution network.

Each VersaTile input and output port has access to nine VersaNets: six chip (main) and three quadrant global networks. The VersaNets can be driven by the CCC or directly accessed from the core via multiplexers (MUXes). The VersaNets can be used to distribute low-skew clock signals or for rapid distribution of high-fanout nets.

I/Os with Advanced I/O Standards

The IGLOO PLUS family of FPGAs features a flexible I/O structure, supporting a range of voltages (1.2 V, 1.5 V, 1.8 V, 2.5 V, 3.0 V wide range, and 3.3 V). IGLOO PLUS FPGAs support many different I/O standards.

The I/Os are organized into four banks. All devices in IGLOO PLUS have four banks. The configuration of these banks determines the I/O standards supported.

Each I/O module contains several input, output, and output enable registers.

Hot-swap (also called hot-plug, or hot-insertion) is the operation of hot-insertion or hot-removal of a card in a powered-up system.

Cold-sparing (also called cold-swap) refers to the ability of a device to leave system data undisturbed when the system is powered up, while the component itself is powered down, or when power supplies are floating.

Wide Range I/O Support

IGLOO PLUS devices support JEDEC-defined wide range I/O operation. IGLOO PLUS devices support both the JESD8-B specification, covering 3 V and 3.3 V supplies, for an effective operating range of 2.7 V to 3.6 V, and JESD8-12 with its 1.2 V nominal, supporting an effective operating range of 1.14 V to 1.575 V.

Wider I/O range means designers can eliminate power supplies or power conditioning components from the board or move to less costly components with greater tolerances. Wide range eases I/O bank management and provides enhanced protection from system voltage spikes, while providing the flexibility to easily run custom voltage applications.

Specifying I/O States During Programming

You can modify the I/O states during programming in FlashPro. In FlashPro, this feature is supported for PDB files generated from Designer v8.5 or greater. See the [FlashPro User's Guide](#) for more information.

Note: PDB files generated from Designer v8.1 to Designer v8.4 (including all service packs) have limited display of Pin Numbers only.

1. Load a PDB from the FlashPro GUI. You must have a PDB loaded to modify the I/O states during programming.
2. From the FlashPro GUI, click PDB Configuration. A FlashPoint – Programming File Generator window appears.
3. Click the Specify I/O States During Programming button to display the Specify I/O States During Programming dialog box.
4. Sort the pins as desired by clicking any of the column headers to sort the entries by that header. Select the I/Os you wish to modify ([Figure 1-4 on page 1-8](#)).
5. Set the I/O Output State. You can set Basic I/O settings if you want to use the default I/O settings for your pins, or use Custom I/O settings to customize the settings for each pin. Basic I/O state settings:

1 – I/O is set to drive out logic High

0 – I/O is set to drive out logic Low

Last Known State – I/O is set to the last value that was driven out prior to entering the programming mode, and then held at that value during programming Z -Tri-State: I/O is tristated

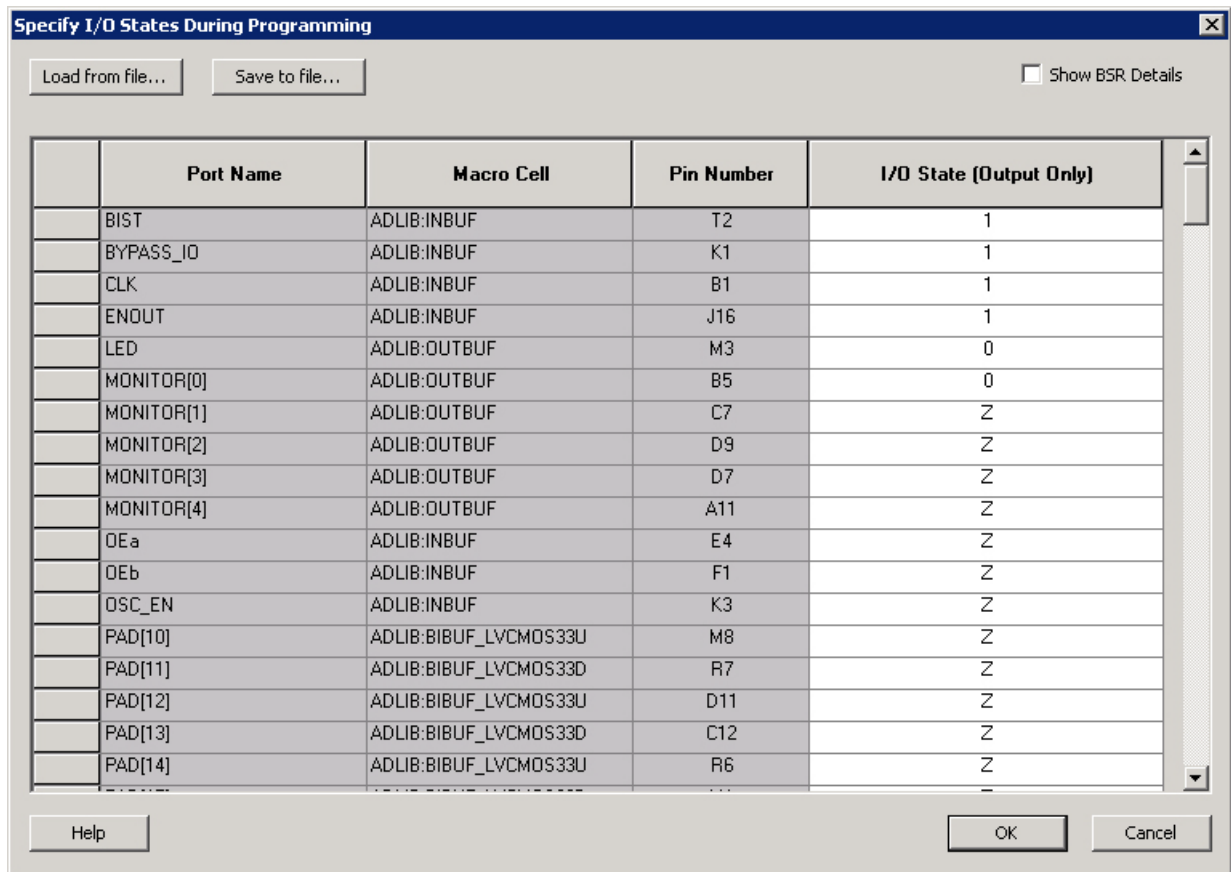

Figure 1-4 • I/O States During Programming Window

- Click OK to return to the FlashPoint – Programming File Generator window.

Note: I/O States During programming are saved to the ADB and resulting programming files after completing programming file generation.

General Specifications

Operating Conditions

Stresses beyond those listed in [Table 2-1](#) may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Absolute Maximum Ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in [Table 2-2 on page 2-2](#) is not implied.

Table 2-1 • Absolute Maximum Ratings

Notes:

1. All parameters representing voltages are measured with respect to GND unless otherwise specified.
2. To ensure targeted reliability standards are met across ambient and junction operating temperatures, Microsemi recommends that the user follow best design practices using Microsemi's timing and power simulation tools.
3. The ranges given here are for power supplies only. The recommended input voltage ranges specific to each I/O standard are given in [Table 2-21 on page 2-19](#). VCCI should be at the same voltage within a given I/O bank.
4. For IGLOO[®] PLUS V5 devices
5. For IGLOO PLUS V2 devices only, operating at VCCI ≥ VCC.
6. All IGLOO PLUS devices (V5 and V2) must be programmed with the VCC core voltage at 1.5 V. Applications using V2 devices powered by a 1.2 V supply must switch the core supply to 1.5 V for in-system programming.
7. VPUMP can be left floating during operation (not programming mode).
8. VCCPLL pins should be tied to VCC pins. See the [Pin Descriptions](#) chapter of the [IGLOO PLUS FPGA Fabric User's Guide](#) for further information.
9. 3.3 V wide range is compliant to the JDEC8b specification and supports 3.0 V VCCI operation.
10. VMV pins must be connected to the corresponding VCCI pins. See the ["Pin Descriptions"](#) chapter of the [IGLOO FPGA Fabric User's Guide](#) for further information.
11. Software Default Junction Temperature Range in the Libero SoC software is set to 0°C to +70°C for commercial, and -40°C to +85°C for industrial. To ensure targeted reliability standards are met across the full range of junction temperatures, Microsemi recommends using custom settings for temperature range before running timing and power analysis tools. For more information regarding custom settings, refer to the [New Project Dialog Box](#) in the [Libero SoC Online Help](#).

Table 2-3 • Flash Programming Limits – Retention, Storage, and Operating Temperature¹

| Product Grade | Programming Cycles | Program Retention (biased/unbiased) | Maximum Storage Temperature T _{STG} (°C) ² | Maximum Operating Junction Temperature T _J (°C) ² |
|---------------|--------------------|-------------------------------------|--|---|
| Commercial | 500 | 20 years | 110 | 100 |
| Industrial | 500 | 20 years | 110 | 100 |

Notes:

1. This is a stress rating only; functional operation at any condition other than those indicated is not implied.
2. These limits apply for program/data retention only. Refer to [Table 2-1 on page 2-1](#) and [Table 2-2 for device operating conditions and absolute limits](#).

Table 2-4 • Overshoot and Undershoot Limits¹

| VCCI | Average VCCI–GND Overshoot or Undershoot Duration as a Percentage of Clock Cycle ² | Maximum Overshoot/Undershoot ² |
|---------------|---|---|
| 2.7 V or less | 10% | 1.4 V |
| | 5% | 1.49 V |
| 3 V | 10% | 1.1 V |
| | 5% | 1.19 V |
| 3.3 V | 10% | 0.79 V |
| | 5% | 0.88 V |
| 3.6 V | 10% | 0.45 V |
| | 5% | 0.54 V |

Notes:

1. Based on reliability requirements at 85°C.
2. The duration is allowed at one out of six clock cycles. If the overshoot/undershoot occurs at one out of two cycles, the maximum overshoot/undershoot has to be reduced by 0.15 V.

I/O Power-Up and Supply Voltage Thresholds for Power-On Reset (Commercial and Industrial)

Sophisticated power-up management circuitry is designed into every IGLOO PLUS device. These circuits ensure easy transition from the powered-off state to the powered-up state of the device. The many different supplies can power up in any sequence with minimized current spikes or surges. In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in [Figure 2-1 on page 2-4](#).

There are five regions to consider during power-up.

IGLOO PLUS I/Os are activated only if ALL of the following three conditions are met:

1. VCC and VCCI are above the minimum specified trip points ([Figure 2-1](#) and [Figure 2-2 on page 2-5](#)).
2. VCCI > VCC – 0.75 V (typical)
3. Chip is in the operating mode.

VCCI Trip Point:

Ramping up (V5 devices): 0.6 V < trip_point_up < 1.2 V

Ramping down (V5 devices): 0.5 V < trip_point_down < 1.1 V

Ramping up (V2 devices): 0.75 V < trip_point_up < 1.05 V

Ramping down (V2 devices): 0.65 V < trip_point_down < 0.95 V

VCC Trip Point:

Ramping up (V5 devices): 0.6 V < trip_point_up < 1.1 V

Ramping down (V5 devices): 0.5 V < trip_point_down < 1.0 V

Ramping up (V2 devices): $0.65\text{ V} < \text{trip_point_up} < 1.05\text{ V}$
 Ramping down (V2 devices): $0.55\text{ V} < \text{trip_point_down} < 0.95\text{ V}$

VCC and VCCI ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to VCCI.
- JTAG supply, PLL power supplies, and charge pump VPUMP supply have no influence on I/O behavior.

PLL Behavior at Brownout Condition

Microsemi recommends using monotonic power supplies or voltage regulators to ensure proper power-up behavior. Power ramp-up should be monotonic at least until VCC and VCCPLX exceed brownout activation levels (see Figure 2-1 and Figure 2-2 on page 2-5 for more details).

When PLL power supply voltage and/or VCC levels drop below the VCC brownout levels ($0.75\text{ V} \pm 0.25\text{ V}$ for V5 devices, and $0.75\text{ V} \pm 0.2\text{ V}$ for V2 devices), the PLL output lock signal goes Low and/or the output clock is lost. Refer to the "Brownout Voltage" section in the "Power-Up/Down Behavior of Low Power Flash Devices" chapter of the *IGLOO PLUS Device Family User's Guide* for information on clock and lock recovery.

Internal Power-Up Activation Sequence

1. Core
2. Input buffers
3. Output buffers, after 200 ns delay from input buffer activation

To make sure the transition from input buffers to output buffers is clean, ensure that there is no path longer than 100 ns from input buffer to output buffer in your design.

Thermal Characteristics

Introduction

The temperature variable in the Microsemi Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction temperature to be higher than the ambient temperature.

EQ 1 can be used to calculate junction temperature.

$$T_J = \text{Junction Temperature} = \Delta T + T_A$$

EQ 1

where:

T_A = Ambient temperature

ΔT = Temperature gradient between junction (silicon) and ambient $\Delta T = \theta_{ja} * P$

θ_{ja} = Junction-to-ambient of the package. θ_{ja} numbers are located in Figure 2-5.

P = Power dissipation

Package Thermal Characteristics

The device junction-to-case thermal resistivity is θ_{jc} and the junction-to-ambient air thermal resistivity is θ_{ja} . The thermal characteristics for θ_{ja} are shown for two air flow rates. The maximum operating junction temperature is 100°C. EQ 2 shows a sample calculation of the maximum operating power dissipation allowed for a 484-pin FBGA package at commercial temperature and in still air.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. (}^\circ\text{C)} - \text{Max. ambient temp. (}^\circ\text{C)}}{\theta_{ja}(\text{}^\circ\text{C/W)}} = \frac{100^\circ\text{C} - 70^\circ\text{C}}{20.5^\circ\text{C/W}} = 1.46 \text{ W}$$

Calculating Power Dissipation

Quiescent Supply Current

Quiescent supply current (I_{DD}) calculation depends on multiple factors, including operating voltages (VCC, VCCI, and VJTAG), operating temperature, system clock frequency, and power mode usage. Microsemi recommends using the Power Calculator and SmartPower software estimation tools to evaluate the projected static and active power based on the user design, power mode usage, operating voltage, and temperature.

Power Calculation Methodology

This section describes a simplified method to estimate power consumption of an application. For more accurate and detailed power estimations, use the SmartPower tool in Libero SoC software.

The power calculation methodology described below uses the following variables:

- The number of PLLs as well as the number and the frequency of each output clock generated
- The number of combinatorial and sequential cells used in the design
- The internal clock frequencies
- The number and the standard of I/O pins used in the design
- The number of RAM blocks used in the design
- Toggle rates of I/O pins as well as VersaTiles—guidelines are provided in [Table 2-19 on page 2-14](#).

Methodology

Total Power Consumption— P_{TOTAL}

$$P_{TOTAL} = P_{STAT} + P_{DYN}$$

P_{STAT} is the total static power consumption.

P_{DYN} is the total dynamic power consumption.

Total Static Power Consumption— P_{STAT}

$$P_{STAT} = (PDC1 \text{ or } PDC2 \text{ or } PDC3) + N_{BANKS} * PDC5$$

N_{BANKS} is the number of I/O banks powered in the design.

Total Dynamic Power Consumption— P_{DYN}

$$P_{DYN} = P_{CLOCK} + P_{S-CELL} + P_{C-CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL}$$

Global Clock Contribution— P_{CLOCK}

$$P_{CLOCK} = (PAC1 + N_{SPINE} * PAC2 + N_{ROW} * PAC3 + N_{S-CELL} * PAC4) * F_{CLK}$$

N_{SPINE} is the number of global spines used in the user design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the [IGLOO PLUS FPGA Fabric User's Guide](#).

N_{ROW} is the number of VersaTile rows used in the design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the [IGLOO PLUS FPGA Fabric User's Guide](#).

F_{CLK} is the global clock signal frequency.

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design.

PAC1, PAC2, PAC3, and PAC4 are device-dependent.

Sequential Cells Contribution— P_{S-CELL}

$$P_{S-CELL} = N_{S-CELL} * (PAC5 + \alpha_1 / 2 * PAC6) * F_{CLK}$$

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design. When a multi-tile sequential cell is used, it should be accounted for as 1.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-19 on page 2-14](#).

F_{CLK} is the global clock signal frequency.

Combinatorial Cells Contribution— P_{C-CELL}

$$P_{C-CELL} = N_{C-CELL} * \alpha_1 / 2 * PAC7 * F_{CLK}$$

N_{C-CELL} is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-19](#) on page 2-14.

F_{CLK} is the global clock signal frequency.

Routing Net Contribution— P_{NET}

$$P_{NET} = (N_{S-CELL} + N_{C-CELL}) * \alpha_1 / 2 * PAC8 * F_{CLK}$$

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design.

N_{C-CELL} is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-19](#) on page 2-14.

F_{CLK} is the global clock signal frequency.

I/O Input Buffer Contribution— P_{INPUTS}

$$P_{INPUTS} = N_{INPUTS} * \alpha_2 / 2 * PAC9 * F_{CLK}$$

N_{INPUTS} is the number of I/O input buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in [Table 2-19](#) on page 2-14.

F_{CLK} is the global clock signal frequency.

I/O Output Buffer Contribution— $P_{OUTPUTS}$

$$P_{OUTPUTS} = N_{OUTPUTS} * \alpha_2 / 2 * \beta_1 * PAC10 * F_{CLK}$$

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in [Table 2-19](#) on page 2-14.

β_1 is the I/O buffer enable rate—guidelines are provided in [Table 2-20](#) on page 2-14.

F_{CLK} is the global clock signal frequency.

RAM Contribution— P_{MEMORY}

$$P_{MEMORY} = PAC11 * N_{BLOCKS} * F_{READ-CLOCK} * \beta_2 + PAC12 * N_{BLOCK} * F_{WRITE-CLOCK} * \beta_3$$

N_{BLOCKS} is the number of RAM blocks used in the design.

$F_{READ-CLOCK}$ is the memory read clock frequency.

β_2 is the RAM enable rate for read operations.

$F_{WRITE-CLOCK}$ is the memory write clock frequency.

β_3 is the RAM enable rate for write operations—guidelines are provided in [Table 2-20](#) on page 2-14.

PLL Contribution— P_{PLL}

$$P_{PLL} = PDC4 + PAC13 * F_{CLKOUT}$$

F_{CLKOUT} is the output clock frequency.¹

Guidelines

Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that this net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100% because all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:

1. If a PLL is used to generate more than one output clock, include each output clock in the formula by adding its corresponding contribution ($PAC13 * F_{CLKOUT}$ product) to the total PLL contribution.

IGLOO PLUS DC and Switching Characteristics

- Bit 0 (LSB) = 100%
- Bit 1 = 50%
- Bit 2 = 25%
- ...
- Bit 7 (MSB) = 0.78125%
- Average toggle rate = $(100\% + 50\% + 25\% + 12.5\% + \dots + 0.78125\%) / 8$

Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When nontristate output buffers are used, the enable rate should be 100%.

Table 2-19 • Toggle Rate Guidelines Recommended for Power Calculation

| Component | Definition | Guideline |
|------------|----------------------------------|-----------|
| α_1 | Toggle rate of VersaTile outputs | 10% |
| α_2 | I/O buffer toggle rate | 10% |

Table 2-20 • Enable Rate Guidelines Recommended for Power Calculation

| Component | Definition | Guideline |
|-----------|--------------------------------------|-----------|
| β_1 | I/O output buffer enable rate | 100% |
| β_2 | RAM enable rate for read operations | 12.5% |
| β_3 | RAM enable rate for write operations | 12.5% |

IGLOO PLUS DC and Switching Characteristics

The length of time an I/O can withstand IOSH/IOSL events depends on the junction temperature. The reliability data below is based on a 3.3 V, 12 mA I/O setting, which is the worst case for this type of analysis.

For example, at 100°C, the short current condition would have to be sustained for more than six months to cause a reliability concern. The I/O design does not contain any short circuit protection, but such protection would only be needed in extremely prolonged stress conditions.

Table 2-31 • Duration of Short Circuit Event before Failure

| Temperature | Time before Failure |
|-------------|---------------------|
| -40°C | > 20 years |
| 0°C | > 20 years |
| 25°C | > 20 years |
| 70°C | 5 years |
| 85°C | 2 years |
| 100°C | 6 months |

|--|-------------------------|
| 3.3 V LVTTTL/LVCMOS (Schmitt trigger mode) | 240 mV |
| 2.5 V LVCMOS (Schmitt trigger mode) | 140 mV |
| 1.8 V LVCMOS (Schmitt trigger mode) | 80 mV |
| 1.5 V LVCMOS (Schmitt trigger mode) | 60 mV |
| 1.2 V LVCMOS (Schmitt trigger mode) | 40 mV |

Table 2-33 • I/O Input Rise Time, Fall Time, and Related I/O Reliability

| Input Buffer | Input Rise/Fall Time (min.) | Input Rise/Fall Time (max.) | Reliability |
|--|-----------------------------|---|------------------|
| LVTTTL/LVCMOS (Schmitt trigger disabled) | No requirement | 10 ns * | 20 years (100°C) |
| LVTTTL/LVCMOS (Schmitt trigger enabled) | No requirement | No requirement, but input noise voltage cannot exceed Schmitt hysteresis. | 20 years (100°C) |

Note: *The maximum input rise/fall time is related to the noise induced into the input buffer trace. If the noise is low, then the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microsemi recommends signal integrity evaluation/characterization of the system to ensure that there is no excessive noise coupling into input signals.

Single-Ended I/O Characteristics

3.3 V LVTTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic (LVTTTL) is a general-purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTTL input buffer and push-pull output buffer.

Global Resource Characteristics

AGLP125 Clock Tree Topology

Clock delays are device-specific. Figure 2-21 is an example of a global tree used for clock routing. The global tree presented in Figure 2-21 is driven by a CCC located on the west side of the AGLP125 device. It is used to drive all D-flip-flops in the device.

Figure 2-21 • Example of Global Tree Use in an AGLP125 Device for Clock Routing

Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard-dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-61. Table 2-84 to Table 2-89 on page 2-60 present minimum and maximum global clock delays within each device. Minimum and maximum delays are measured with minimum and maximum loading.

| $t_{RCKMPWL}$ | Minimum Pulse Width Low for Global Clock | 1.15 | | ns |
| t_{RCKSW} | Maximum Skew for Global Clock | | 0.27 | ns |

Notes:

- Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
- Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
- For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.

Notes:

- Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
- Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
- For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.

| 50 MHz to 250 MHz | 2.50% | 4.00% | 6.00% | 12.00% | | | |

Notes:

1. This delay is a function of voltage and temperature. See [Table 2-6 on page 2-6](#) and [Table 2-7 on page 2-6](#) for deratings.
2. $T_J = 25^\circ\text{C}$, $V_{CC} = 1.5\text{ V}$
3. When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the [Libero SoC Online Help](#) associated with the core for more information.
4. Maximum value obtained for a STD speed grade device in Worst Case Commercial Conditions. For specific junction temperature and voltage supply, refer to [Table 2-6 on page 2-6](#) and [Table 2-7 on page 2-6](#) for derating values.
5. The AGLP030 device does not support a PLL.
6. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to the PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by the period jitter parameter.
7. VCO output jitter is calculated as a percentage of the VCO frequency. The jitter (in ps) can be calculated by multiplying the VCO period by the per cent jitter. The VCO jitter (in ps) applies to CCC_OUT regardless of the output divider settings. For example, if the jitter on VCO is 300 ps, the jitter on CCC_OUT is also 300 ps, regardless of the output divider settings.
8. Measurements done with LVTTTL 3.3 V 8 mA I/O drive strength and high slew rate, $V_{CC}/V_{CCPLL} = 1.425\text{ V}$, $V_{CCI} = 3.3\text{ V}$, VQ/PQ/TQ type of packages, 20 pF load.
9. SSO are outputs that are synchronous to a single clock domain and have clock-to-out times that are within $\pm 200\text{ ps}$ of each other. Switching I/Os are placed outside of the PLL bank. Refer to the "Simultaneously Switching Outputs (SSOs) and Printed Circuit Board Layout" section in the [IGLOO PLUS FPGA Fabric User's Guide](#).

Notes:

1. This delay is a function of voltage and temperature. See [Table 2-6 on page 2-6](#) and [Table 2-7 on page 2-6](#) for deratings.
2. $T_J = 25^\circ\text{C}$, $V_{CC} = 1.2\text{ V}$
3. When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the online help associated with the core for more information.
4. Maximum value obtained for a STD speed grade device in Worst Case Commercial Conditions. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-6](#) and [Table 2-7 on page 2-6](#) for derating values.

3 – Pin Descriptions and Packaging

Supply Pins

GND**Ground**

Ground supply voltage to the core, I/O outputs, and I/O logic.

GNDQ**Ground (quiet)**

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.

VCC**Core Supply Voltage**

Supply voltage to the FPGA core, nominally 1.5 V for IGLOO PLUS V5 devices, and 1.2 V or 1.5 V for IGLOO PLUS V2 devices. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.

For IGLOO PLUS V2 devices, VCC can be switched dynamically from 1.2 V to 1.5 V or vice versa. This allows in-system programming (ISP) when VCC is at 1.5 V and the benefit of low power operation when VCC is at 1.2 V.

VCCIBx**I/O Supply Voltage**

Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are four I/O banks on low power flash devices plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCIBx supply. VCCI can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VCCI pins tied to GND.

VMVx**I/O Supply Voltage (quiet)**

Quiet supply voltage to the input buffers of each I/O bank. x is the bank number. Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks. This minimizes the noise transfer within the package and improves input signal integrity. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMVx supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMVx can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCIB0, VMV1 to VCCIB1, etc.).

VCCPLA/B/C/D/E/F**PLL Supply Voltage**

Supply voltage to analog PLL, nominally 1.5 V or 1.2 V, depending on the device.

- 1.5 V for IGLOO PLUS V5 devices
- 1.2 V or 1.5 V for IGLOO PLUS V2 devices

When the PLLs are not used, the Microsemi Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section of the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed signal FPGAs " chapter of the *IGLOO PLUS FPGA Fabric User's Guide* for a complete board solution for the PLL analog power supply and ground.

There is one VCCPLF pin on IGLOO PLUS devices.

VCOMPLA/B/C/D/E/F PLL Ground

Ground to analog PLL power supplies. When the PLLs are not used, the Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground.

There is one VCOMPLF pin on IGLOO PLUS devices.

VJTAG JTAG Supply Voltage

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND. It should be noted that VCC is required to be powered for JTAG operation; VJTAG alone is insufficient. If a device is in a JTAG chain of interconnected boards, the board containing the device can be powered down, provided both VJTAG and VCC to the part remain powered; otherwise, JTAG signals will not be able to transition the device, even in bypass mode.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

VPUMP Programming Supply Voltage

IGLOO PLUS devices support single-voltage ISP of the configuration flash and FlashROM. For programming, VPUMP should be 3.3 V nominal. During normal device operation, VPUMP can be left floating or can be tied (pulled up) to any voltage between 0 V and the VPUMP maximum. Programming power supply voltage (VPUMP) range is listed in the datasheet.

When the VPUMP pin is tied to ground, it will shut off the charge pump circuitry, resulting in no sources of oscillation from the charge pump circuitry.

For proper programming, 0.01 μ F and 0.33 μ F capacitors (both rated at 16 V) are to be connected in parallel across VPUMP and GND, and positioned as close to the FPGA pins as possible.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

User Pins

I/O User Input/Output

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected.

During programming, I/Os become tristated and weakly pulled up to VCCI. With VCCI, VMV, and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os are instantly configured to the desired user configuration.

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)
- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

GL Globals

GL I/Os have access to certain clock conditioning circuitry (and the PLL) and/or have direct access to the global network (spines). Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities. Unused GL pins are configured as inputs with pull-up resistors.

See more detailed descriptions of global I/O connectivity in the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the *IGLOO PLUS FPGA Fabric User's Guide*. All inputs labeled GC/GF are direct inputs into the quadrant clocks. For example, if GAA0 is used for an input, GAA1 and GAA2 are no longer available for input to the quadrant globals. All inputs labeled GC/GF are direct inputs into the chip-level globals, and the rest are connected to the quadrant globals. The inputs to the global network are multiplexed, and only one input can be used as a global input.

Refer to the I/O Structure chapter of the *IGLOO PLUS FPGA Fabric User's Guide* for an explanation of the naming of global pins.

FF Flash*Freeze Mode Activation Pin

The FF pin is a dedicated input pin used to enter and exit Flash*Freeze mode. The FF pin is active low, has the same characteristics as a single-ended I/O, and must meet the maximum rise and fall times. When Flash*Freeze mode is not used in the design, the FF pin is available as a regular I/O.

When Flash*Freeze mode is used, the FF pin must not be left floating to avoid accidentally entering Flash*Freeze mode. While in Flash*Freeze mode, the Flash*Freeze pin should be constantly asserted.

The Flash*Freeze pin can be used with any single-ended I/O standard supported by the I/O bank in which the pin is located, and input signal levels compatible with the I/O standard selected. The FF pin should be treated as a sensitive asynchronous signal. When defining pin placement and board layout, simultaneously switching outputs (SSOs) and their effects on sensitive asynchronous pins must be considered.

Unused FF or I/O pins are tristated with weak pull-up. This default configuration applies to both Flash*Freeze mode and normal operation mode. No user intervention is required.

Table 3-1 shows the Flash*Freeze pin location on the available packages for IGLOO and ProASIC3L devices. The Flash*Freeze pin location is independent of device (except for a PQ208 package), allowing migration to larger or smaller IGLOO devices while maintaining the same pin location on the board. Refer to the "Flash*Freeze Technology and Low Power Modes" chapter of the *IGLOO PLUS Device Family User's Guide* for more information on I/O states during Flash*Freeze mode.

Table 3-1 • Flash*Freeze Pin Location in IGLOO PLUS Devices

|---------|------------------|
| CS281 | W2 |
| CS201 | R4 |
| CS289 | U1 |
| VQ128 | 34 |
| VQ176 | 47 |

JTAG Pins

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). VCC must also be powered for the JTAG state machine to operate, even if the device is in bypass mode; VJTAG alone is insufficient. Both VJTAG and VCC to the part must be supplied to allow JTAG signals to transition the device. Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND.

TCK Test Clock

Test clock input for JTAG boundary scan, ISP, and UJTAG. The TCK pin does not have an internal pull-up/down resistor. If JTAG is not used, Microsemi recommends tying off TCK to GND through a resistor placed close to the FPGA pin. This prevents JTAG operation in case TMS enters an undesired state.

Note that to operate at all VJTAG voltages, 500 Ω to 1 k Ω will satisfy the requirements. Refer to [Table 3-2](#) for more information.

Table 3-2 • Recommended Tie-Off Values for the TCK and TRST Pins

| VJTAG | Tie-Off Resistance |
|----------------|------------------------------|
| VJTAG at 3.3 V | 200 Ω to 1 k Ω |
| VJTAG at 2.5 V | 200 Ω to 1 k Ω |
| VJTAG at 1.8 V | 500 Ω to 1 k Ω |
| VJTAG at 1.5 V | 500 Ω to 1 k Ω |

Notes:

1. Equivalent parallel resistance if more than one device is on the JTAG chain
2. The TCK pin can be pulled up/down.
3. The TRST pin is pulled down.

TDI Test Data Input

Serial input for JTAG boundary scan, ISP, and UJTAG usage. There is an internal weak pull-up resistor on the TDI pin.

TDO Test Data Output

Serial output for JTAG boundary scan, ISP, and UJTAG usage.

TMS Test Mode Select

The TMS pin controls the use of the IEEE 1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

TRST Boundary Scan Reset Pin

The TRST pin functions as an active-low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the test access port (TAP) is held in reset mode. The resistor values must be chosen from [Table 3-2](#) and must satisfy the parallel resistance value requirement. The values in [Table 3-2](#) correspond to the resistor recommended when a single device is used, and the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

In critical applications, an upset in the JTAG circuit could allow entrance to an undesired JTAG state. In such cases, Microsemi recommends tying off TRST to GND through a resistor placed close to the FPGA pin.

Note that to operate at all VJTAG voltages, 500 Ω to 1 k Ω will satisfy the requirements.

Special Function Pins

NC

No Connect

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

DC

Do Not Connect

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

Packaging

Semiconductor technology is constantly shrinking in size while growing in capability and functional integration. To enable next-generation silicon technologies, semiconductor packages have also evolved to provide improved performance and flexibility.

Microsemi consistently delivers packages that provide the necessary mechanical and environmental protection to ensure consistent reliability and performance. Microsemi IC packaging technology efficiently supports high-density FPGAs with large-pin-count Ball Grid Arrays (BGAs), but is also flexible enough to accommodate stringent form factor requirements for Chip Scale Packaging (CSP). In addition, Microsemi offers a variety of packages designed to meet your most demanding application and economic requirements for today's embedded and mobile systems.

5 – Datasheet Information

List of Changes

The following table lists critical changes that were made in each revision of the IGLOO PLUS datasheet.

| Revision | Changes | Page |
|---------------------------------|---|---------------------------------|
| Revision 18 (October 2019) | Updated the note for "VQ128" section in "Package Pin Assignments" section | 4-1 |
| | Updated the note for "VQ176" section in "Package Pin Assignments" section | 4-4 |
| Revision 17 (December 2015) | Updated Commercial and Industrial temperature range to show junction temperature in "IGLOO PLUS Ordering Information" section and "Temperature Grade Offerings" section (SAR 73547). | 1-III, 1-IV |
| | Removed Ambient temperature parameter in Table 2-2 • Recommended Operating Conditions ^{1,2} (SAR 73547). | 2-2 |
| | Table notes are added to Table 2-2 • Recommended Operating Conditions ^{1,2} stating that: <ul style="list-style-type: none"> • VMV pins must be connected to the corresponding VCCI pins. • Software default junction temperature range in the Libero SoC software is set to 0°C to +70°C for commercial, and -40°C to +85°C for industrial. | 2-2 |
| | Updated Table 2-5 • Package Thermal Resistivities (SAR 60078). | 2-6 |
| | Added 2 mA drive strength information in the following tables (SAR 57182): <ul style="list-style-type: none"> • Table 2-36 • 3.3 V LVTTTL / 3.3 V LVCMOS Low Slew – Applies to 1.5 V DC Core Voltage • Table 2-37 • 3.3 V LVTTTL / 3.3 V LVCMOS High Slew – Applies to 1.5 V DC Core Voltage • Table 2-38 • 3.3 V LVTTTL / 3.3 V LVCMOS Low Slew – Applies to 1.2 V DC Core Voltage • Table 2-39 • 3.3 V LVTTTL / 3.3 V LVCMOS High Slew – Applies to 1.2 V DC Core Voltage | 2-28, 2-28, 2-28, 2-29 |
| | Fixed typo for "VQ128" section in "Package Pin Assignments" section | 4-1 |
| Revision 16 (December 2012) | The "IGLOO PLUS Ordering Information" section has been updated to mention "Y" as "Blank" mentioning "Device Does Not Include License to Implement IP Based on the Cryptography Research, Inc. (CRI) Patent Portfolio" (SAR 43175). | III |
| | The note in Table 2-90 • IGLOO PLUS CCC/PLL Specification and Table 2-91 • IGLOO PLUS CCC/PLL Specification referring the reader to SmartGen was revised to refer instead to the online help associated with the core (SAR 42566). | 2-61, 2-62 |
| | Live at Power-Up (LAPU) has been replaced with 'Instant On'. | NA |
| Revision 15 (October 2012) | Values updated for IGLOO PLUS V2 or V5 Devices, 1.5 V Core Supply Voltage in Table 2-15 • Different Components Contributing to Dynamic Power Consumption in IGLOO PLUS Devices and for IGLOO PLUS V2 Devices, 1.2 V Core Supply Voltage in Table 2-17 • Different Components Contributing to Dynamic Power Consumption in IGLOO PLUS Devices (SAR 31988). Also added a new Note to the two tables. | 2-10, 2-11 |
| | Libero Integrated Design Environment (IDE) was changed to Libero System-on-Chip (SoC) throughout the document (SAR 40277). | N/A |
| Revision 14 (September 2012) | The "Security" section was modified to clarify that Microsemi does not support read-back of programmed data. | 1-2 |

| Revision | Changes | Page |
|-----------------------------|---|--------|
| Revision 13 (June 2012) | Figure 2-30 • FIFO Read and Figure 2-31 • FIFO Write have been added (SAR 34843). | 2-73 |
| | Updated the terminology used in Timing Characteristics in the following tables: Table 2-96 • FIFO and Table 2-97 • FIFO (SAR 38236). | 2-76 |
| | The following sentence was removed from the "VMVx I/O Supply Voltage (quiet)" section in the "Pin Descriptions and Packaging" section: "Within the package, the VMV plane is decoupled from the simultaneous switching noise originating from the output buffer VCCI domain" and replaced with "Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks" (SAR 38320). The datasheet mentions that "VMV pins must be connected to the corresponding VCCI pins" for an ESD enhancement. | 3-1 |
| Revision 12 (March 2012) | The "In-System Programming (ISP) and Security" section and "Security" section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 34664). | I, 1-2 |
| | The Y security option and Licensed DPA Logo were added to the "IGLOO PLUS Ordering Information" section. The trademarked Licensed DPA Logo identifies that a product is covered by a DPA counter-measures license from Cryptography Research (SAR 34724). | III |
| | The "Specifying I/O States During Programming" section is new (SAR 34695). | 1-7 |
| | The following sentence was removed from the "Advanced Architecture" section: "In addition, extensive on-chip programming circuitry allows for rapid, single-voltage (3.3 V) programming of IGLOO PLUS devices via an IEEE 1532 JTAG interface" (SAR 34684). | 1-3 |

| Revision | Changes | Page |
|--|---|---------------------------------|
| Revision 12 (continued) | The reference to guidelines for global spines and VersaTile rows, given in the "Global Clock Contribution— P_{CLOCK} " section, was corrected to the "Spine Architecture" section of the Global Resources chapter in the <i>IGLOO PLUS FPGA Fabric User's Guide</i> (SAR 34733). | 2-12 |
| | t_{DOUT} was corrected to t_{DIN} in Figure 2-4 • Input Buffer Timing Model and Delays (example) (SAR 37107). | 2-16 |
| | The AC Loading figures in the "Single-Ended I/O Characteristics" section were updated to match tables in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section (SAR 34887). | 2-27 |
| | Minimum pulse width High and Low values were added to the tables in the "Global Tree Timing Characteristics" section. The maximum frequency for global clock parameter was removed from these tables because a frequency on the global is only an indication of what the global network can do. There are other limiters such as the SRAM, I/Os, and PLL. SmartTime software should be used to determine the design frequency (SAR 36963). | 2-58 |
| | Table 2-90 • IGLOO PLUS CCC/PLL Specification and Table 2-91 • IGLOO PLUS CCC/PLL Specification were updated. A note was added to both tables indicating that when the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available (SAR 34820). The value for serial clock was missing from these tables and has been restored. The value and units for input cycle-to-cycle jitter were incorrect and have been restored. The note to Table 2-90 • IGLOO PLUS CCC/PLL Specification giving specifications for which measurements done was corrected from VCC/VCCPLL = 1.14 V to VCC/VCCPLL = 1.425 V. The Delay Range in Block: Programmable Delay 2 value in Table 2-91 • IGLOO PLUS CCC/PLL Specification was corrected from 0.025 to 0.863 (SAR 37058). | 2-61, 2-62 |
| | Figure 2-28 • Write Access after Read onto Same Address was deleted. Reference was made to a new application note, <i>Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs</i> , which covers these cases in detail (SAR 34868). The port names in the SRAM "Timing Waveforms", SRAM "Timing Characteristics" tables, Figure 2-32 • FIFO Reset, and the FIFO "Timing Characteristics" tables were revised to ensure consistency with the software names (SAR 35748). | 2-65, 2-68, 2-74, 2-76 |
| | The "Pin Descriptions and Packaging" chapter has been added (SAR 34769). | 3-1 |
| Package names used in the "Package Pin Assignments" section were revised to match standards given in <i>Package Mechanical Drawings</i> (SAR 34769). | 4-1 | |
| Revision 11 (July 2010) | The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The "IGLOO PLUS Device Status" table indicates the status for each device in the family. | N/A |
| | The "Reprogrammable Flash Technology" section was revised to add "250 MHz (1.5 V systems) and 160 MHz (1.2 V systems) System Performance." | I |
| | The "I/Os with Advanced I/O Standards" section was revised to add definitions for hot-swap and cold-sparing. | 1-6 |
| | Conditional statements regarding hot insertion were removed from the description of VI in Table 2-1 • Absolute Maximum Ratings, since all IGLOO PLUS devices are hot insertion enabled. | 2-1 |

| Revision | Changes | Page |
|----------------------------|--|---------------|
| Revision 11 (continued) | Table 2-2 • Recommended Operating Conditions ^{1,2} was revised. 1.2 V DC wide range supply voltage and 3.3 V wide range supply voltage (SAR 26270) were added for VCCI. VJTAG DC Voltage was revised (SAR 24052). The value range for VPUMP programming voltage for operation was changed from "0 to 3.45" to "0 to 3.6" (SAR 25220). | 2-2 |
| | Table 2-6 • Temperature and Voltage Derating Factors for Timing Delays (normalized to T _J = 70°C, VCC = 1.425 V) and Table 2-7 • Temperature and Voltage Derating Factors for Timing Delays (normalized to T _J = 70°C, VCC = 1.14 V) were revised. | 2-6, 2-6 |
| | Table 2-8 • Power Supply State per Mode is new. | 2-7 |
| | The tables in the "Quiescent Supply Current" section were updated (SARs 24882 and 24112). Some of the table notes were changed or deleted. | 2-7 |
| | VIH maximum values in tables were updated as needed to 3.6 V (SARs 20990, 79370). | N/A |
| | The values in the following tables were updated. 3.3 V LVCMOS and 1.2 V LVCMOS wide range were added to the tables where applicable. | |
| | Table 2-13 • Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings | 2-9 |
| | Table 2-14 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings ¹ | 2-9 |
| | Table 2-21 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions—Software Default Settings | 2-19 |
| | Table 2-22 • Summary of Maximum and Minimum DC Input Levels | 2-20 |
| | Table 2-23 • Summary of AC Measuring Points | 2-20 |

| | Table 2-26 • Summary of I/O Timing Characteristics—Software Default Settings, STD Speed Grade Commercial-Case Conditions: T _J = 70°C, Worst-Case VCC = 1.14 V, Worst-Case VCCI = 3.0 V | 2-23 |
| | Table 2-28 • I/O Output Buffer Maximum Resistances ¹ | 2-24 |
| | A table note was added to Table 2-16 • Different Components Contributing to the Static Power Consumption in IGLOO PLUS Devices and Table 2-18 • Different Components Contributing to the Static Power Consumption in IGLOO PLUS Devices stating the value for PDC4 is the minimum contribution of the PLL when operating at lowest frequency. | 2-10, 2-11 |
| | Table 2-29 • I/O Weak Pull-Up/Pull-Down Resistances was revised, including addition of 3.3 V and 1.2 V LVCMOS wide range. The notes defining R _{WEAK PULL-UP-MAX} and R _{WEAK PULLDOWN-MAX} were revised (SAR 21348). | 2-25 |
| | Table 2-30 • I/O Short Currents IOSH/IOSL was revised to include data for 3.3 V and 1.2 V LVCMOS wide range (SAR 79353 and SAR 79366). | 2-25 |
| | Table 2-31 • Duration of Short Circuit Event before Failure was revised to change the maximum temperature from 110°C to 100°C, with an example of six months instead of three months (SAR 26259). | 2-26 |

|----------------------------|--|-------------------|
| Revision 11 (continued) | <p>The tables in the "Single-Ended I/O Characteristics" section were updated. Notes clarifying IIL and IIH were added.</p> <p>Tables for 3.3 V LVCMOS and 1.2 V LVCMOS wide range were added (SAR 79370, SAR 79353, and SAR 79366).</p> <p>Notes in the wide range tables state that the minimum drive strength for any LVCMOS 3.3 V (or LVCMOS 1.2 V) software configuration when run in wide range is $\pm 100 \mu\text{A}$. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models (SAR 25700).</p> | 2-27 |
| | <p>The following sentence was deleted from the "2.5 V LVCMOS" section: It uses a 5 V-tolerant input buffer and push-pull output buffer (SAR 24916).</p> | 2-32 |
| | <p>The tables in the "Input Register" section, "Output Register" section, and "Output Enable Register" section were updated. The tables in the "VersaTile Characteristics" section were updated.</p> | 2-45 through 2-56 |
| | <p>The following tables were updated in the "Global Tree Timing Characteristics" section:</p> <p>Table 2-85 • AGLP060 Global Resource (1.5 V)</p> <p>Table 2-86 • AGLP125 Global Resource (1.5 V)</p> <p>Table 2-88 • AGLP060 Global Resource (1.2 V)</p> | 2-58 |
| | <p>Table 2-90 • IGLOO PLUS CCC/PLL Specification and Table 2-91 • IGLOO PLUS CCC/PLL Specification were revised (SAR 79388). VCO output jitter and maximum peak-to-peak jitter data were changed. Three notes were added to the table in connection with these changes.</p> | 2-61 |
| | <p>Figure 2-28 • Write Access after Write onto Same Address and Figure 2-29 • Write Access after Read onto Same Address were deleted.</p> | N/A |
| | <p>The tables in the "SRAM", "FIFO" and "Embedded FlashROM Characteristics" sections were updated.</p> | 2-68, 2-78 |

| Revision | Changes | Page |
|---|--|---------------|
| Revision 10 (Apr 2009) Product Brief v1.5 DC and Switching Characteristics Advance v0.5 | The –F speed grade is no longer offered for IGLOO PLUS devices. References to it have been removed from the document. The speed grade column and note regarding –F speed grade were removed from "IGLOO PLUS Ordering Information". The "Speed Grade and Temperature Grade Matrix" section was removed. | III, IV |
| Revision 9 (Feb 2009) Product Brief v1.4 | The "Advanced I/O" section was revised to add two bullets regarding support of wide range power supply voltage. | I |
| | The "I/Os with Advanced I/O Standards" section was revised to add 3.0 V wide range to the list of supported voltages. The "Wide Range I/O Support" section is new. | 1-7 |
| Revision 8 (Jan 2009) Packaging v1.5 | The "CS201" pin table was revised to add a note regarding pins G1 and H1. | 4-8 |
| Revision 7 (Dec 2008) Product Brief v1.3 | A note was added to IGLOO PLUS Devices: "AGLP060 in CS201 does not support the PLL." | I |
| | Table 2 • IGLOO PLUS FPGAs Package Size Dimensions was updated to change the nominal size of VQ176 from 100 to 400 mm ² . | II |
| Revision 6 (Oct 2008) DC and Switching Characteristics Advance v0.4 | Data was revised significantly in the following tables: Table 2-25 • Summary of I/O Timing Characteristics—Software Default Settings, STD Speed Grade, Commercial-Case Conditions: T _J = 70°C, Worst-Case VCC = 1.425 V, Worst-Case VCCI = 3.0 V Table 2-26 • Summary of I/O Timing Characteristics—Software Default Settings, STD Speed Grade Commercial-Case Conditions: T _J = 70°C, Worst-Case VCC = 1.14 V, Worst-Case VCCI = 3.0 V Table 2-50 • 2.5 LVCMOS Low Slew – Applies to 1.2 V DC Core Voltage Table 2-51 • 2.5 V LVCMOS High Slew – Applies to 1.2 V DC Core Voltage | 2-22, 2-33 |
| Revision 5 (Aug 2008) Product Brief v1.2 Packaging v1.4 | The VQ128 and VQ176 packages were added to Table 1 • IGLOO PLUS Product Family, the "I/Os Per Package" table, Table 2 • IGLOO PLUS FPGAs Package Size Dimensions, "IGLOO PLUS Ordering Information", and the "Temperature Grade Offerings" table. | I to IV |
| | The "VQ128" package drawing and pin table are new. | 4-2 |
| | The "VQ176" package drawing and pin table are new. | 4-5 |
| Revision 4 (Jul 2008) Product Brief v1.1 DC and Switching Characteristics Advance v0.3 | As a result of the Libero IDE v8.4 release, Actel now offers a wide range of core voltage support. The document was updated to change 1.2 V / 1.5 V to 1.2 V to 1.5 V. | N/A |
| Revision 3 (Jun 2008) DC and Switching Characteristics Advance v0.2 | Tables have been updated to reflect default values in the software. The default I/O capacitance is 5 pF. Tables have been updated to include the LVCMOS 1.2 V I/O set. | N/A |
| | Table note 3 was updated in Table 2-2 • Recommended Operating Conditions ^{1,2} to add the sentence, "VCCI should be at the same voltage within a given I/O bank." References to table notes 5, 6, 7, and 8 were added. Reference to table note 3 was removed from VPUMP Operation and placed next to VCC. | 2-2 |
| | Table 2-4 • Overshoot and Undershoot Limits ¹ was revised to remove "as measured on quiet I/Os" from the title. Table note 2 was revised to remove "estimated SSO density over cycles." Table note 3 was deleted. | 2-3 |

| Revision | Changes | Page |
|---|--|------------|
| Revision 3 (continued) | The table note for Table 2-9 • Quiescent Supply Current (IDD) Characteristics, IGLOO PLUS Flash*Freeze Mode* to remove the sentence stating that values do not include I/O static contribution. | 2-7 |
| | The table note for Table 2-10 • Quiescent Supply Current (IDD) Characteristics, IGLOO PLUS Sleep Mode* was updated to remove VJTAG and VCCI and the statement that values do not include I/O static contribution. | 2-7 |
| | The table note for Table 2-11 • Quiescent Supply Current (IDD) Characteristics, IGLOO PLUS Shutdown Mode was updated to remove the statement that values do not include I/O static contribution. | 2-7 |
| | Note 2 of Table 2-12 • Quiescent Supply Current (IDD), No IGLOO PLUS Flash*Freeze Mode 1 was updated to include VCCPLL. Table note 4 was deleted. | 2-8 |
| | Table 2-13 • Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings and Table 2-14 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings ¹ were updated to remove static power. The table notes were updated to reflect that power was measured on VCC _I . Table note 2 was added to Table 2-13 • Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings. | 2-9, 2-9 |
| | Table 2-16 • Different Components Contributing to the Static Power Consumption in IGLOO PLUS Devices and Table 2-18 • Different Components Contributing to the Static Power Consumption in IGLOO PLUS Devices were updated to change the definition for P _{DC5} from bank static power to bank quiescent power. Table subtitles were added for Table 2-16 • Different Components Contributing to the Static Power Consumption in IGLOO PLUS Devices, Table 2-17 • Different Components Contributing to Dynamic Power Consumption in IGLOO PLUS Devices, and Table 2-18 • Different Components Contributing to the Static Power Consumption in IGLOO PLUS Devices. | 2-10, 2-11 |
| | The "Total Static Power Consumption—P _{STAT} " section was revised. | 2-12 |
| | Table 2-32 • Schmitt Trigger Input Hysteresis is new. | 2-26 |
| Packaging v1.3 | The "CS281" package drawing is new. | 4-13 |
| | The "CS281" table for the AGLP125 device is new. | 4-13 |
| Revision 3 (continued) | The "CS289" package drawing was incorrect. The graphic was showing the CS281 mechanical drawing and not the CS289 mechanical drawing. This has now been corrected. | 4-17 |
| Revision 2 (Jun 2008) Packaging v1.2 | The "CS289" table for the AGLP030 device is new. | 4-17 |
| Revision 1 (Jun 2008) Packaging v1.1 | The "CS289" table for the AGLP060 device is new. | 4-20 |
| | The "CS289" table for the AGLP125 device is new. | 4-23 |

Datasheet Categories

Categories

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device, as highlighted in the "IGLOO PLUS Device" table on page II, is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

Advance

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

Preliminary

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

Production

This version contains information that is considered to be final.

Export Administration Regulations (EAR)

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

Safety Critical, Life Support, and High-Reliability Applications Policy

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group's products is available at http://www.microsemi.com/soc/documents/ORT_Report.pdf. Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.
