

## Description

The AL1663/AL1663R is a high performance single stage Flyback and Buck-boost controller, targeting dimmable LED lighting application. It is a primary side regulation (PSR) controller which can provide accurate constant current (CC) regulation without opto-coupler and secondary control circuitry. It is operating at BCM mode and switching at the valley which results in good EMI and efficiency. With working in constant on time, the system achieves high PF and low total harmonic distortion (THD) under universal input voltage.

The AL1663/AL1663R can support multiple dimming modes. When a 0.3V to 2.4V DC signal is applied on APWM pin, the device will operate in analog dimming mode. When a digital signal is applied on APWM pin, the device works at PWM dimming mode. And for AL1663 When a digital signal is applied on PWMD pin and the APWM pin is connected with a hundreds of nF capacitor, the device will work in PWM-to-DC dimming mode.

The AL1663/AL1663R features low start-up current and low operation current. It integrates multiple protections including over voltage, short circuit, over current and over temperature protection.

The AL1663/AL1663R is available in SO-8 package.

## Features

- Primary Side Regulation without Opto-coupler
- Valley Switching for Low Switching Loss
- Low Start-up Current
- High PF and Low THD
- High Efficiency
- Tight LED Current Variation Range
- Tight Output Open Voltage Variation Range
- Support both PWM Dimming and Analog Dimming
- Internal Protections
  - Under Voltage Lock Out (UVLO)
  - Output Over Voltage Protection (OVP)
  - Output Short Protection (OSP)
  - Over Current Protection (OCP)
  - Thermal Fold-back Protection (TFP)
  - Over Temperature Protection (OTP)
- Low System Cost
- Package: SO-8
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green" Device (Note 3)**

Notes:

1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS) & 2011/65/EU (RoHS 2) compliant.
2. See [http://www.diodes.com/quality/lead\\_free.html](http://www.diodes.com/quality/lead_free.html) for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

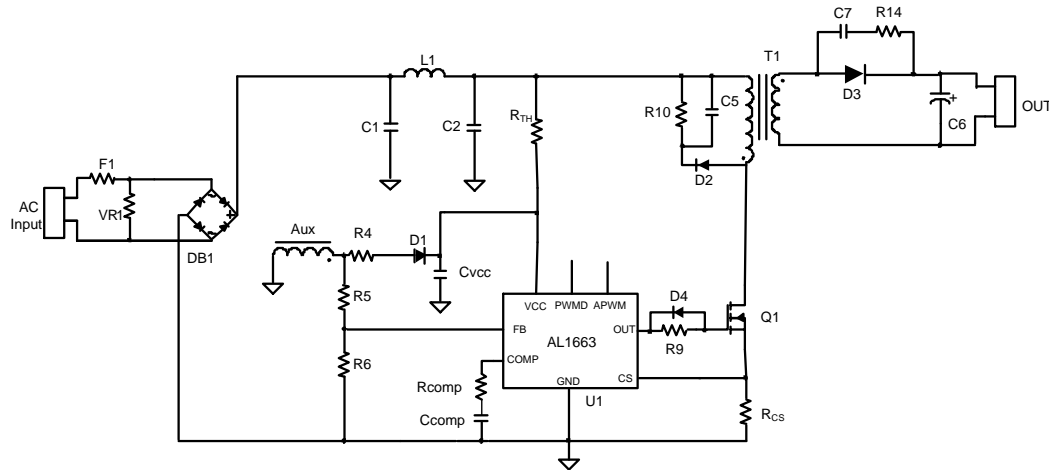

## Pin Assignments

## Applications

- General LED Lighting Driver with Dimming Function
- General Purpose Constant Current Source
- LED Backlighting Driver
- Smart LED Lighting

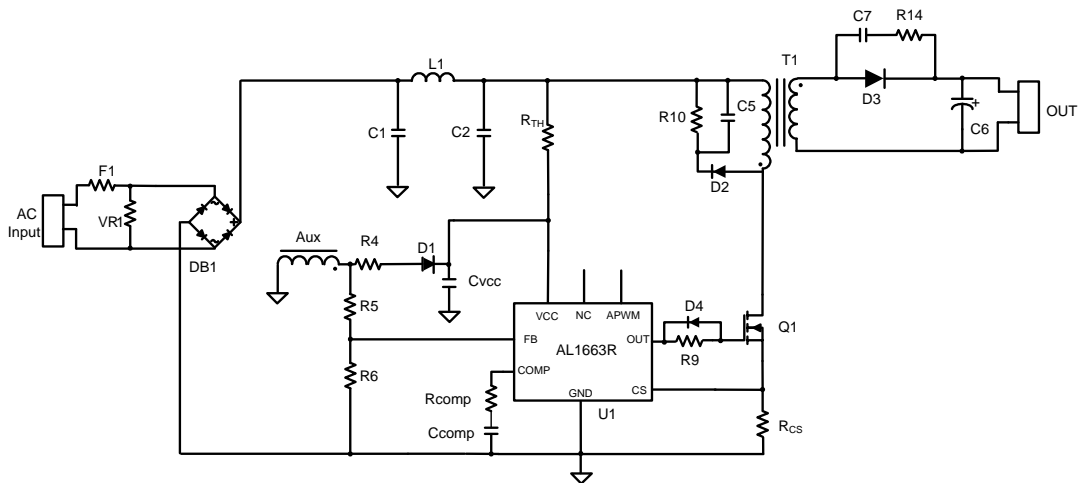

**Typical Applications Circuit**

AL1663 Flyback Application Circuit

AL1663 Buck-Boost Application Circuit

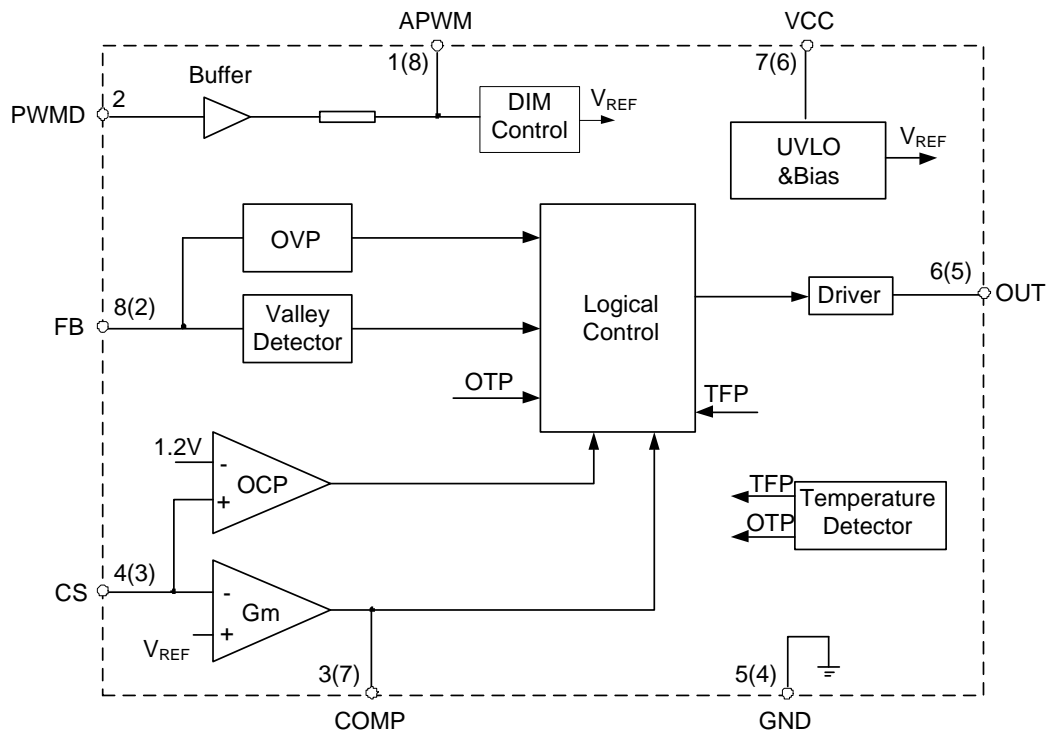

AL1663R Flyback Application Circuit

## Pin Descriptions

Pin Number		Pin Name	Function
AL1663	AL1663R		
1	8	APWM	Analog dimming input pin or PWM signal input pin in PWM dimming mode
2	—	PWMD	PWMD signal input pin in PWM-to-DC dimming mode
—	1	NC	Not Connected
3	7	COMP	Loop compensation pin
4	3	CS	Current sense pin, connect this pin to the source of the primary switch
5	4	GND	Ground
6	5	OUT	Gate driver output
7	6	VCC	Supply voltage of gate driver and control circuits of the IC
8	2	FB	The feedback voltage sensing from the auxiliary winding

## Functional Block Diagram

B for AL1663R

### Absolute Maximum Ratings (@T<sub>A</sub> = +25°C, unless otherwise specified.) (Note 4)

Symbol	Parameter	Rating	Unit
V <sub>CC</sub>	Power Supply Voltage	-0.3 to 30	V
V <sub>CS</sub>	Voltage at CS to GND	-0.3 to 7	V
V <sub>FB</sub>	FB Input	-0.3 to 7	V
V <sub>COMP</sub>	Loop Compensation Pin	-0.3 to 7	V
V <sub>OUT</sub>	Driver Output Voltage	-0.3 to 20	V
V <sub>PWMD</sub>	Voltage at PWMD to GND	-0.3 to 7	V
V <sub>APWM</sub>	Voltage at APWM to GND	-0.3 to 7	V
T <sub>J</sub>	Operating Junction Temperature	-40 to +150	°C
T <sub>STG</sub>	Storage Temperature	-65 to +150	°C
T <sub>LEAD</sub>	Lead Temperature (Soldering, 10 sec)	+300	°C
P <sub>D</sub>	Power Dissipation at T <sub>A</sub> = +50°C	0.65	W
θ <sub>JA</sub>	Thermal Resistance (Junction to Ambient)	150	°C/W
θ <sub>JC</sub>	Thermal Resistance (Junction to Case)	23	°C/W
—	ESD (Human Body Model)	2000	V
	CDM (Charged-Device Model)	1000	V

Note: 4. Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “Recommended Operating Conditions” is not implied. Exposure to “Absolute Maximum Ratings” for extended periods may affect device reliability. All voltages unless otherwise stated and measured with respect to GND.

### Recommended Operating Conditions (@T<sub>A</sub> = +25°C, unless otherwise specified.)

Symbol	Parameter	Min	Max	Unit
T <sub>A</sub>	Ambient Temperature (Note 5)	-40	+105	°C

Note: 5. The device may operate normally at +125°C ambient temperature under the condition not triggers temperature protection.

**Electrical Characteristics** (@ $T_A = +25^\circ\text{C}$ , unless otherwise specified.)

Symbol	Parameter	Condition	Min	Typ	Max	Unit
<b>UVLO Section</b>						
$V_{CC\_TH}$	Startup Threshold Voltage	—	17	18.5	20	V

$V_{APWM\_H}$	PWM Signal High Threshold Voltage	—	2.4	—	—	V
—	Linear Dimming Range on APWM	—	0.3	—	2.4	V
<b>PWMD Section</b>						
$V_{PWM\_L}$	PWM Signal Low Threshold Voltage	—	—	—	0.4	V
$V_{PWM\_H}$	PWM Signal High Threshold Voltage	—	2	—	—	V
<b>Thermal Fold-back Section</b>						
$T_{REG}$	Overheating Temperature Regulation (Note 6)	—	—	+145	—	$^\circ\text{C}$
<b>Over Temperature Protection Section</b>						
—	Shutdown Temperature (Notes 6, 7)	—	—	+165	—	$^\circ\text{C}$

Notes: 6. These parameters, although guaranteed by design, are not 100% tested in production.

7. The device will latch when OTP happens and the device won't operate constantly at this temperature.

**Performance Characteristics** (Note 8)

**Startup Threshold Voltage vs. Ambient Temperature**

**Minimum Operating Voltage vs. Ambient Temperature**

**Operating Current vs. Ambient Temperature**

**FB CV Threshold vs. Ambient Temperature**

**Internal Reference Voltage vs. Ambient Temperature**

**FB CV Threshold vs.  $V_{CC}$  Voltage**

**Performance Characteristics (Cont.)**

Note: 8. These electrical characteristics are tested under DC condition. The ambient temperature is equal to the junction temperature of the device.

**Application Information**

The AL1663/AL1663R is a constant current high PF Flyback and Buck-boost controller with primary side regulation (PSR), targeting LED lighting applications. The device eliminates the opto-couplers or the secondary feedback circuits, which will help to cost down the whole system. High power factor is achieved by constant on time operation. In order to reduce the switching losses and improve EMI performance, quasi-resonant switching mode is applied. The AL1663/AL1663R integrates multiple protections including UVLO protection, V<sub>CC</sub> over voltage protection, output open voltage protection, over current protection, thermal fold-back protection and over temperature protection. The AL1663/AL1663R can support multiple dimming modes including analog dimming mode, PWM-to-DC dimming mode and PWM dimming.

Figure 1. AL1663 Typical Flyback Application Schematic

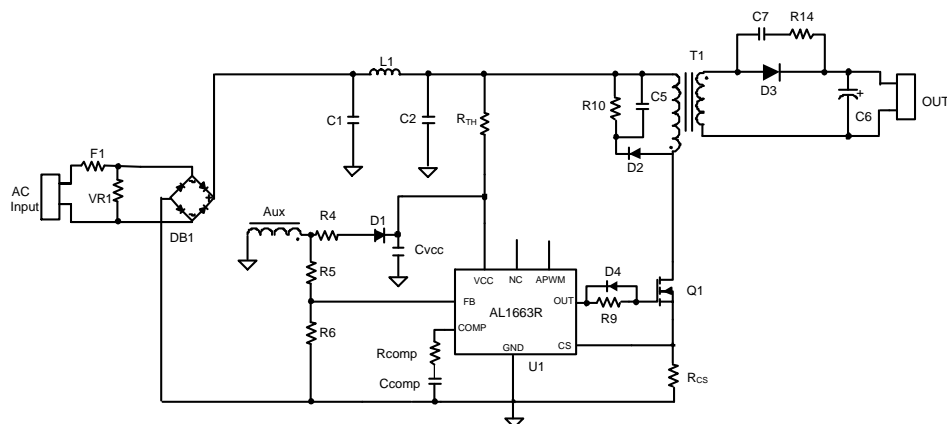

Figure 2. AL1663R Flyback Application Circuit

## Application Information (Cont.)

### Start-up

After AC supply is powered on, the capacitor  $C_{VCC}$  across VCC and GND pin will be charged up by BUS voltage through a start-up resistor  $R_{TH}$ . Once  $V_{CC}$  reaches  $V_{CC\_TH}$ , the internal blocks start to work.  $V_{CC}$  will be supplied by  $V_{BUS}$  until the auxiliary winding of Flyback transformer could supply enough energy to maintain  $V_{CC}$  above  $V_{OPR\_MIN}$ . If  $V_{CC}$  voltage is lower than  $V_{OPR\_MIN}$  switch will be turned off.

After  $V_{CC}$  exceeds  $V_{CC\_TH}$ , the drive block won't start to switch on/off signals until  $V_{COMP}$  is over the initial voltage  $V_{COMP\_ST}$  which can be programmed by  $R_{COMP}$ . The formula is shown as below. Such design can program startup on time to reduce the startup time or reduce the output overshoot current.

$$V_{COMP\_ST} = 1.4V - 700\mu A \cdot R_{COMP}$$

Where  $V_{COMP\_ST}$  is the pre-charged voltage of COMP pin.  $R_{COMP}$  is shown as Figures 1 and 2.

Generally, a big capacitance of  $C_{COMP}$  is necessary to achieve high power factor and stabilize the system loop (1 $\mu$ F to 2 $\mu$ F is recommended). The pre-charged voltage in start-up procedure can be programmed by  $R_{COMP}$ .

### Protections

#### 1. Output Open Protection (OVP)

The output voltage is reflected by the voltage on transformer's auxiliary winding. Both FB pin and VCC pin of IC integrate over voltage protection function. When there is a rapid line and load transient, the output voltage may exceed the regulated value. If  $V_{CC}$  exceeds  $V_{CC\_OVP}$  or  $V_{FB}$  exceeds  $V_{FB\_CV}$ , the over voltage protection will be triggered, switch will be turned off and  $V_{CC}$  will be discharged. Once  $V_{CC}$  is below  $V_{OPR\_MIN}$ , the IC will shut down and be powered on again by BUS voltage through start up resistor.

Thus, output over voltage depends on the minimum voltage between both OVP protections' limitation. It can be gotten by below formula.

$$V_{OVP} = \text{Min} \left( \frac{N_S}{N_{AUX}} \cdot V_{CC\_OVP}, \frac{N_S}{N_{AUX}} \cdot \frac{R5 + R6}{R6} \cdot V_{FB\_CV} \right)$$

Where  $V_{OVP}$  is the output over voltage setting; R5 and R6 that is shown as Figure 1 divide reflected voltage.

$N_{AUX}$  is the turns of auxiliary wind;  $N_S$  is turns of the secondary wind.  $V_{CC\_OVP}$  is OVP Voltage of  $V_{CC}$ .

#### 2. Output short protection (OSP)

When the output is shorted, the output voltage is clamped to zero. The output voltage of the auxiliary winding, which is proportional to the output winding, will drop down too. Once  $V_{CC}$  is below  $V_{OPR\_MIN}$ , the IC will shut down and power on again by the BUS voltage through the start up resistor.

#### 3. Over Current Protection (OCP)

The AL1663/AL1663R has a build-in cycle by cycle over current protection of primary inductor current. When CS pin voltage reaches the voltage  $V_{CS\_OCP}$ , switch will be turned off until next switch period. The maximum peak current ( $I_{PEAK(MAX)}$ ) of the inductor can be calculated as below:

$$I_{PEAK(MAX)} = \frac{V_{CS\_OCP}}{R_{CS}}$$

Where  $V_{CS\_OCP}$  means primary current clamp voltage that is 1.2V.

$R_{CS}$  is current sense resistor which is shown as Figures 1 and 2.

#### 4. Thermal Fold-back Protection (TFP)

The AL1663/AL1663R has thermal fold-back function: it adopts self-adaptive control method which can prevent the system from breaking down caused by over temperature. The overheating temperature is set at +145°C. When the temperature of the IC is higher than this point; the device will decrease the voltage reference of the CS linearly till OTP happens. By this way, the device can limit system's input power at high ambient temperature, preventing system's temperature increases further.

## Application Information (Cont.)

### 5. Over Temperature Protection (OTP)

The AL1663/AL1663R has build-in over temperature protection (OTP) function. When the temperature goes up to +165°C, the over temperature protection will be triggered, which leads to a latch mode protection. When OTP happens, the system need to be powered off and on again to restart.

### Output Constant-current Control

According to the definition of mean output current, the mean output current can be obtained as below.

$$I_{O\_MEAN} = \frac{1}{\pi} \cdot \int_0^{\pi} \frac{1}{2} \cdot I_{SP} \cdot \frac{t_{ONS}}{t_{SW}} dt$$

Where  $I_{O\_MEAN}$  is the mean output current;  $I_{SP}$  is secondary peak current of transformer;  $t_{ONS}$  is discharge time of secondary side of transformer;  $t_{SW}$  is the switch period.

According to the principle of AL1663/AL1663R close loop control, the voltage of  $R_{CS}$  will be sampled when switch is turned off and the value will be held until discharge time  $t_{ONS}$  is over. It can be described by following formula:

$$V_{REF} = \frac{1}{\pi} \cdot \int_0^{\pi} I_P \cdot R_{CS} \cdot \frac{t_{ONS}}{t_{SW}} dt$$

Where  $I_P$  is primary peak current of transformer;  $R_{CS}$  is current sense resistor which is shown as Figures 1 and 2.  $t_{ONS}$  is discharge time of secondary side of transformer;  $t_{SW}$  is the switch period.  $V_{REF}$  is internal reference voltage that is equal to 0.3V. The peak current at secondary side has following relationship with primary side peak current, if the effect of the leakage inductor is neglected.

$$I_{SP} = N_{PS} \cdot I_P$$

Where  $N_{PS}$  is the turns ratio of Flyback transformer ( $N_{PS}=1$  for Buck-boost);  $I_P$  is the primary peak current of the transformer.

According to these above formulas, the mean output current can be induced finally by below expressions.

$$I_{O\_MEAN} = \frac{N_{PS} \cdot V_{REF}}{2 \cdot R_{CS}}$$

Where  $I_{O\_MEAN}$  is the mean output current;  $R_{CS}$  is current sense resistor which is shown as Figures 1 and 2;  $V_{REF}$  is internal reference voltage that is equal to 0.3V;  $N_{PS}$  is the turns ratio of Flyback transformer ( $N_{PS}=1$  for Buck-boost); Therefore, the constant output current control can be realized with appropriate parameter design.

### PF and THD compensation circuit

For normal application, AL1663/AL1663R can provide high PF and low THD. But there is a phase difference between input current and input voltage especially at high input voltage, thus PF and THD may not be the best situation. The below circuit can optimize this situation by reducing the phase difference.  $V_{BUS}$  is connected to the voltage point after rectifier. In normal application resistor  $R_{N1}$  is usually a several hundred kΩ resistor,  $R_{N2}$  is a hundred Ω resistor,  $C_{N1}$  is a several μF capacitor. PF and THD can be improved by debugging these components.

Figure 3. PF and THD Optimization Circuit

**Application Information** (Cont.)

**Dimming Mode**

The AL1663 can support three dimming modes: analog dimming, PWM-to-DC dimming and PWM dimming. The AL1663R can support two dimming modes: analog dimming and PWM dimming.

**1. Analog Dimming Mode**

In analog dimming mode, the dimming signal is added to APWM pin directly to realize dimming function. The setting circuit is shown as Figure 4. A capacitance of hundreds nF is recommended for C<sub>APWM</sub>. When V<sub>APWM</sub> is higher than 2.4V, the driver will output 100% of rated current; when the voltage V<sub>APWM</sub> is in the range from 0.3 to 2.4V, the output current will change linearly with the voltage V<sub>APWM</sub>. When V<sub>APWM</sub> is lower than 0.3V, switch will be turned off and the output current drops to zero. The dimming curve is shown as Figure 5 and the dimming range is from 12% to 100%.

Figure 4. Analog Dimming Setting Circuit

Figure 5. Analog Dimming Curve

**2. PWM-to-DC Dimming Mode**

In PWM-to-DC dimming mode, PWM dimming signal is added to PWMD pin. The setting circuit is shown as below Figure 6. A capacitance of hundreds nF is recommended for C<sub>APWM</sub>. The duty cycle of the dimming signal D<sub>DIM</sub> is reflected by the voltage on APWM pin V<sub>APWM</sub>.

$$V_{APWM} = D_{DIM} \times 2.4V$$

Where D<sub>DIM</sub> is duty of PWM signal; V<sub>APWM</sub> is the voltage of APWM pin.

Thus the output current will change with the duty cycle of dimming signal D<sub>DIM</sub>. For example, the dimming curve is shown as Figure 7. The dimming range is 12% to 100%.

Figure 6. PWM to DC Dimming Setting Circuit

Figure 7. PWM to DC Dimming Curve (PWM Frequency is 500Hz)

**3. PWM Dimming Mode**

In PWM dimming mode, dimming signal will be added to APWM pin. The setting circuit is shown as Figure 8. The output current is chopped by the dimming signal directly. The logic high level of the dimming signal needs to be higher 2.4V while the logic low level is lower than 0.3V. Switch is turned off at logic low level. The dimming curve is shown as Figure 9. The dimming range can be 100 to 1% with 1kHz frequency of PWM signal.

Figure 8. PWM Dimming Setting Circuit

Figure 9. PWM Dimming Curve (PWM Frequency is 1 KHz)

## Application Information (Cont.)

### Operation Parameters Design

#### Setting the Current Sense Resistor $R_{CS}$

The current sense resistance can be calculated as following:

$$R_{CS} = \frac{N_{PS} \cdot V_{REF}}{2 \cdot I_{O\_MEAN}}$$

Where  $I_{O\_MEAN}$  is the mean output current;  $R_{CS}$  is current sense resistor which is shown as Figures 1 and 2;

$V_{REF}$  is internal reference voltage that is equal to 0.3V;  $N_{PS}$  is the turns ratio of Flyback transformer ( $N_{PS}=1$  for Buck-boost).

#### Setting Transformer Selection (T1)

$N_{PS}$  is limited by the electrical stress of the switch MOSFET, can be calculated by below formula.

$$N_{PS} \leq \frac{V_{MOS(BR)DS} \cdot 90\% - \sqrt{2} \cdot V_{IN\_MAX} - \Delta V_S}{V_O + V_{D\_F}}$$

Where  $V_{MOS(BR)DS}$  is the breakdown voltage of the switch MOSFET.  $V_{IN\_MAX}$  is the max rated input voltage.  $\Delta V_S$  is the overshoot voltage clamped by RCD snobbier during OFF time.  $V_O$  is the output voltage.  $V_{D\_F}$  is the forward voltage of secondary diode.  $N_{PS}$  is the turns ratio of Flyback transformer ( $N_{PS}=1$  for Buck-boost);

For boundary conduction mode and constant on time method, the peak current of primary inductance can be calculated as below.

$$I_P = \frac{2 \cdot \pi \cdot I_{O\_MEAN}}{N_{PS} \cdot \int_0^{\pi} \sin(\theta) \cdot \frac{\sqrt{2} \cdot V_{IN\_RMS} \cdot \sin(\theta)}{\sqrt{2} \cdot V_{IN\_RMS} \cdot \sin(\theta) + N_{PS} \cdot V_O} d\theta}$$

Where  $V_{IN\_RMS}$  is the rate input voltage;  $I_P$  is the primary inductance current.  $N_{PS}$  is the turns ratio of Flyback transformer ( $N_{PS}=1$  for Buck-boost);  $I_{O\_MEAN}$  is the mean output current;  $V_O$  is the output voltage.

The switching frequency is not constant for AL1663/AL1663R due to boundary conduction mode. To set the minimum switching frequency  $f_{MIN}$  at the crest of the minimum AC input, primary inductance can be obtained by below formula.

$$L_P = \frac{\sqrt{2} \cdot V_{IN\_RMS} \cdot N_{PS} \cdot V_O}{I_P \cdot (\sqrt{2} V_{IN\_RMS} + N_{PS} V_O) \cdot f_{MIN}}$$

Where  $V_{IN\_RMS}$  is the rate input voltage;  $I_P$  is the primary inductance current.  $N_{PS}$  is the turns ratio of Flyback transformer ( $N_{PS}=1$  for Buck-boost);

$I_{O\_MEAN}$  is the mean output current;  $V_O$  is the output voltage;  $f_{MIN}$  is the minimum switching frequency at the crest of the minimum AC input.

According to the Faraday's Law, the winding number of the inductance can be calculated by:

$$N_P = \frac{L_P \cdot I_P}{A_e \cdot B_m}$$

$$N_S = \frac{N_P}{N_{PS}}$$

Where,

$A_e$  is the core effective area.

$B_m$  is the maximum magnetic flux density.
