

Description

The DIODES™ AL8862 is a step-down DC/DC converter designed to drive LEDs with a constant current. The AL8862 operates with an input supply voltage from 5V to 60V and provides an externally-adjustable output current up to 1A. Series connection of the LEDs provides identical LED currents, resulting in uniform brightness and eliminating the need for ballast resistors. The AL8862 switches at frequencies up to 1MHz. This allows the use of smaller-sized external components, hence minimizing the PCB size.

The AL8862 integrates the power switch and a high-side output current-sensing circuit. Maximum output current of the AL8862 is set via an external resistor connected between the VIN and SET input pins. Dimming is achieved by applying either a DC voltage or a PWM signal at the CTRL input pin. The soft-start time can be adjusted using an external capacitor from the CTRL pin to ground. An input voltage of 0.3V or lower at CTRL pin will shut down the power switch.

Features

- Wide Input Voltage Range: 5V to 60V
- Output Current up to 1A
- Internal 60V NDMOS Switch
- Typical 4% Output Current Accuracy
- Single Pin for On/Off and Brightness Control by DC Voltage or PWM Signal
- High-Efficiency (Up to 97%)
- LED Short-Circuit Protection
- Inherent Open-Circuit LED Protection
- Current-Sense Resistor Short-Circuit Protection
- Overtemperature Shutdown
- Up to 1MHz Switching Frequency
- SO-8EP and U-DFN3030-6 Packages Available in Green Molding Compound (No Br, Sb)
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen- and Antimony-Free. "Green" Device (Note 3)**
- **An Automotive-Compliant Part is Available Under Separate Datasheet ([AL8862Q](#))**

- Notes:
1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS), 2011/65/EU (RoHS 2) & 2015/863/EU (RoHS 3).compliant.
 2. See <https://www.diodes.com/quality/lead-free/> for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
 3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

Pin Assignments

Applications

- Commercial & industrial lightings
- Appliances interior lightings
- Architecture detail lightings
- External drivers with multiple channels and smart lightings

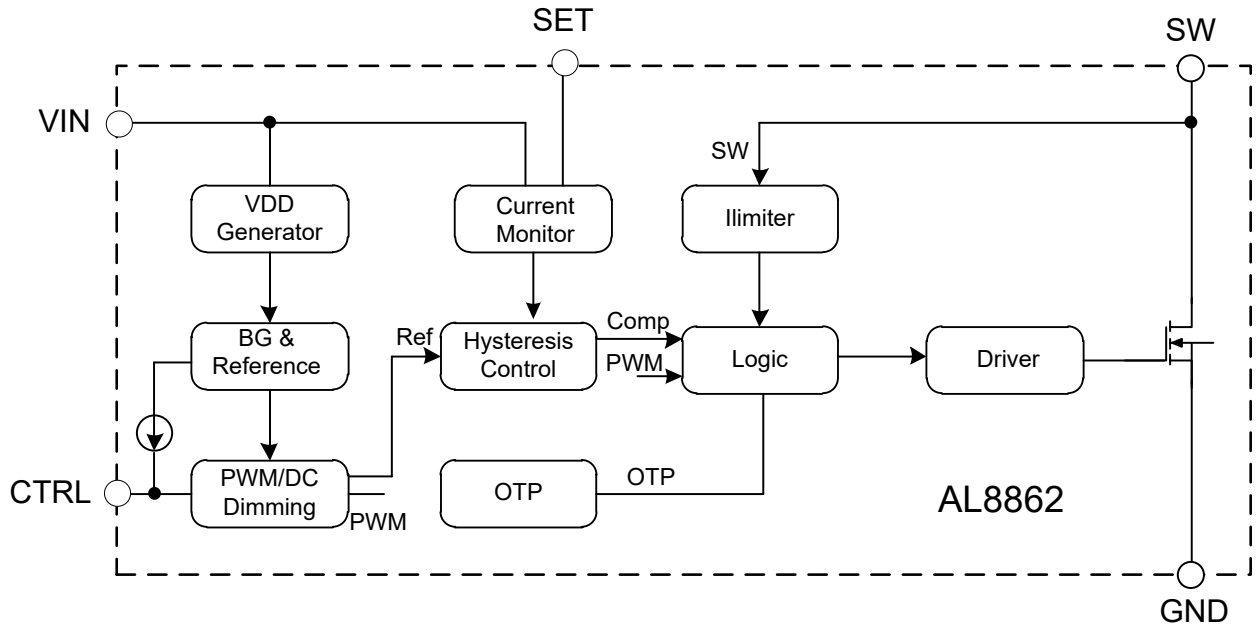

Typical Applications Circuit

Pin Descriptions

| Pin Number (SO-8EP) | Pin Number (U-DFN3030-6) | Pin Name | Function |
|---------------------|--------------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | 4 | SET | Set Nominal Output Current Pin. Connect resistor R_{SET} from this pin to VIN to define nominal average output current. |
| 2, 7 | 2, 5 | GND | Ground of IC |
| 3 | — | NC | No connection |
| 4 | 6 | VIN | Input voltage (5V to 60V). Decouple to ground with 10 μ F or higher X7R ceramic capacitor close to device. |
| 5,6 | 1 | SW | Switch Pin. Connect inductor/freewheeling diode here, minimizing track length at this pin to reduce EMI. |
| 8 | 3 | CTRL | Multi-function On/Off and brightness control pin: Leave floating for normal operation. Drive to voltage below 0.3V to turn off output current Drive with DC voltage ($0.4V < V_{SET} < 2.5V$) to adjust output current from 10% to 100% of I_{OUT_NOM} Drive with an analog voltage $>2.6V$ output current will be 100% of I_{OUT_NOM} A PWM signal (Low level $<0.3V$, High level $>2.6V$, transition times less than 1 μ s) allows the output current to be adjusted over a wide range up to 100% Connect a capacitor from this pin to ground to increase soft-start time. (Default soft-start time = 0.1ms. Additional soft-start time is approx. 1.5ms/1nF) |
| EP | EP | EP | Exposed pad/TAB connects to GND and thermal mass for enhanced thermal impedance. |

Functional Block Diagram

Absolute Maximum Ratings (Note 4)

| Symbol | Parameter | Rating | Unit |
|------------------------------------|-------------------------------------|-------------|------|
| V _{IN} | Input Voltage | -0.3 to 65 | V |
| V _{SW} , V _{SET} | SW, SET Pin Voltage | -0.3 to 65 | V |
| V _{CTRL} | CTRL Pin Input Voltage | -0.3 to 6 | V |
| T _A | Operating Ambient Temperature | -40 to +105 | °C |
| T _J | Operating Junction Temperature | -40 to +150 | °C |
| T _{STG} | Storage Temperature Range | -65 to +150 | °C |
| T _{LEAD} | Lead Temperature (Soldering, 10sec) | +300 | °C |

Note: 4. Stresses greater than those listed under "Absolute Maximum Ratings" can cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to Absolute Maximum Ratings for extended periods can affect device reliability. Besides, if the voltage on CTRL Pin is higher than 5V, the device will enter the test mode for parameter test. Therefore, the voltage on CTRL Pin should keep below 5V for normal operation.

ESD Ratings

| Symbol | Parameter | Rating | Unit |
|--------|----------------------------|--------|------|
| VESD | Human-Body Model (HBM) | 2000 | V |
| | Charged-Device Model (CDM) | 750 | |

Recommended Operating Conditions

| Symbol | Parameter | Min | Max | Unit |
|------------------------|----------------------------------------------------------|-----|------|------|
| V _{IN} | Input Voltage | 5 | 60 | V |
| f _{sw} | Switching Frequency | — | 1 | MHz |
| I _{OUT} | Continuous Output Current | — | 1 | A |
| V _{CTRL} | Voltage Range for 10% to 100% DC Dimming Relative to GND | 0.4 | 2.5 | V |
| V _{CTRL_HIGH} | Voltage High for PWM Dimming Relative to GND | 2.6 | 5 | V |
| V _{CTRL_LOW} | Voltage Low for PWM Dimming Relative to GND | 0 | 0.3 | V |
| T _A | Operating Ambient Temperature | -40 | +105 | °C |
| T _J | Operating Junction Temperature | -40 | +125 | °C |

Thermal Information (Note 5)

| Package | θ_{JC} Thermal Resistance Junction-to-Case | θ_{JA} Thermal Resistance Junction-to-Ambient |
|-------------|---------------------------------------------------------|------------------------------------------------------------|
| SO-8EP | 6.4°C/W | 58°C/W |
| U-DFN3030-6 | 16.5°C/W | 72.7°C/W |

Note: 5. Device mounted on 2"×2" FR-4 substrate PCB, 2oz copper, with minimum recommended pad layout.

Application Information

AL8862 Operation

In normal operation, when normal input voltage is applied at V_{IN} , the AL8862 internal switch will turn on. Current starts to flow through sense resistor R_{SET} , inductor L1, and the LEDs. The current ramps up linearly, and the ramp-up rate is determined by the input voltage V_{IN} , V_{OUT} and the inductor L1.

This rising current produces a voltage ramp across R_{SET} . The internal circuit of the AL8862 senses the voltage across R_{SET} and applies a proportional voltage to the input of the internal comparator. When this voltage reaches an internally-set upper threshold, the internal switch is turned off. The inductor current continues to flow through R_{SET} , L1, LEDs, and diode D1, and back to the supply rail; but it decays, with the rate determined by the forward voltage drop of LEDs and the diode D1.

This decaying current produces a falling voltage on R_{SET} , which is sensed by the AL8862. A voltage proportional to the sense voltage across R_{SET} will be applied at the input of internal comparator. When this voltage falls to the internally-set lower threshold, the internal switch is turned on again. This switch-on-and-off cycle continues to provide the average LED current set by the sense resistor R_{SET} .

LED Current Configuration

The nominal average output current in the LED(s) is determined by the value of the external current sense resistor (R_{SET}) connected between V_{IN} and SET and is given by:

$$I_{OUT(NOM)} = \frac{0.1}{R_{SET}}$$

The table below gives values of nominal average output current for several preferred values of current setting resistor (R_{SET}) in the typical application circuit shown on page 1.

| R_{SET} (Ω) | Nominal Average Output Current (mA) |
|------------------------|-------------------------------------|
| 0.1 | 1000 |
| 0.15 | 667 |
| 0.3 | 333 |

The above values assume that the CTRL pin is floating and at a nominal reference voltage for internal comparator. It is possible to use different values of R_{SET} if the CTRL pin is driven by an external dimming signal.

Analog Dimming

Application of a DC voltage from 0.4V to 2.5V on the CTRL pin can adjust output current from 10% to 100% of I_{OUT_NOM} linearly, as shown in Figure 1. If the CTRL pin is brought higher than 2.5V, the LED current will clamp to 100% of I_{OUT_NOM} . If the CTRL voltage falls below 0.3V, the output switch will turn off.

PWM Dimming

LED current can be adjusted digitally, by applying a low frequency pulse-width-modulated (PWM) logic signal to the CTRL pin to turn the device on and off. This will produce an average output current proportional to the duty cycle of the control signal. To achieve a high resolution, the PWM frequency is recommended to be lower than 500Hz, however higher dimming frequencies can be used, at the expense of dimming dynamic range and accuracy. Typically, for a PWM frequency of 500Hz, the accuracy is better than 1% for PWM ranging from 1% to 100%.

The accuracy of the low duty cycle dimming is affected by both the PWM frequency and also the switching frequency of the AL8862. For best accuracy/resolution, the switching frequency should be increased while the PWM frequency should be reduced.

The CTRL pin is designed to be driven by both 3.3V and 5V logic levels directly from a logic output with either an open drain output or push pull output stage.

Application Information (continued)

Figure 1. Analog Dimming Curve

Soft Start

The default soft-start time for the AL8862 is 0.1ms—this provides very fast turn on of the output, improving PWM dimming accuracy.

Nevertheless, adding an external capacitor from the CTRL pin to ground will provide a longer soft-start delay. This is achieved by increasing the time for the CTRL voltage rising to the turn-on threshold and by slowing down the rising rate of the control voltage at the input of hysteresis comparator. The additional soft-start time is related to the capacitance between CTRL and GND, the typical value will be 1.5ms/nF.

Capacitor Selection

A low ESR capacitor should be used for input decoupling, as the ESR of this capacitor appears in series with the supply source impedance and will lower overall efficiency. This capacitor has to supply the relatively high peak current to the coil and smooth the ripple on the input current.

The minimum capacitance needed is determined by the input power, cable's length, and peak current. 4.7~10μF is a commonly used value for most of cases. A higher value will improve performance at lower input voltages, especially when the source impedance is high. The input capacitor should be placed as close as possible to the IC.

For maximum stability overtemperature and voltage, capacitors with X7R, X5R, or better dielectrics are recommended. Capacitors with Y5V dielectrics are not suitable for decoupling in this application and should NOT be used.

Diode Selection

For maximum efficiency and performance, the freewheeling diode (D1) should be a fast, low capacitance Schottky diode with low reverse leakage current. It also provides better efficiency than silicon diodes, due to lower forward voltage and reduced recovery time.

It is important to select parts with a peak current rating above the peak coil current and a continuous current rating higher than the maximum output load current. It is very important to consider the reverse leakage current of the diode when operating above +85°C. Excess leakage current will increase power dissipation.

The higher forward voltage and overshoot due to reverse recovery time in silicon diodes will increase the peak voltage on the SW output. If a silicon diode is used, more care should be taken to ensure that the total voltage appearing on the SW pin, including supply ripple, won't exceed the specified maximum value.

Application Information (continued)

Inductor Selection

Recommended inductor values for the AL8862 are in the ranges 33μH to 100μH. Higher inductance is recommended at higher supply voltages to minimize output current tolerance due to switching delays, which will result in increased ripple and lower efficiency. Higher inductance also results in a better line regulation. The inductor should be mounted as close to the device as possible with low resistance connections to SW pins.

The chosen coil should have saturation current higher than the peak output current and a continuous current rating above the required mean output current.

The inductor value should be chosen to maintain operating duty cycle and switch “on”/“off” times within the specified limits over the supply voltage and load current range. The following equations can be used as a guide.

SW Switch “On” time

$$t_{ON} = \frac{L\Delta I}{V_{IN} - V_{LED} - I_{LED}(R_{SET} + R_L + R_{SW})}$$

SW Switch “Off” time

$$t_{OFF} = \frac{L\Delta I}{V_{LED} + V_D + I_{LED}(R_{SET} + R_L)}$$

Where: L is the coil inductance; R_L is the coil resistance; R_{SET} is the current sense resistance; I_{LED} is the required LED current; ΔI is the coil peak-peak ripple current (Internally set to $0.26 \times I_{LED}$); V_{IN} is the supply voltage; V_{LED} is the total LED forward voltage; R_{SW} is the switch resistance (0.55Ω nominal); V_D is the diode forward voltage at the required load current.

Thermal Protection

The AL8862 includes Overtemperature Protection (OTP) circuitry that will turn off the device if its junction temperature gets too high. This is to protect the device from excessive heat damage. The OTP circuitry includes thermal hysteresis that will cause the device to restart normal operation once its junction temperature has cooled down by approximately +30°C.

Open-Circuit LED Protection

The AL8862 has, by default, open LED protection. If the LEDs should become open circuit, the AL8862 will stop oscillating; the SET pin will rise to V_{IN} , and the SW pin will then fall to GND. No excessive voltages will be seen by the AL8862.

LED Short-Circuit Protection

If the LED string becomes shorted together (the anode of the top LED becomes shorted to the cathode of the bottom LED), the AL8862 will continue to switch and the current through the AL8862’s internal switch will still be at the expected current. Thus, no excessive heat will be generated within the AL8862. However, the duty cycle at which it operates will change dramatically and the switching frequency will most likely decrease. See Figure 2 for an example of this behavior at 24V input voltage driving 3 LEDs.

The on-time of the internal power MOSFET switch is significantly reduced because almost all of the input voltage is now developed across the inductor. The off-time is significantly increased because the reverse voltage across the inductor is now just the Schottky diode voltage (See Figure 2), causing a much slower decay in inductor current.

Application Information (continued)

Figure 2. Switching Characteristics (Normal Operation to LED String Shorted)

Current Sense Resistor Short-Circuit Protection

The AL8862 has an internal current limit at about 3A. If the current-sense resistor R_{SET} is shorted out, the AL8862 will operate at maximum duty cycle of 100%. See Figure 3, the inductor current keeps going up until the internal 3A current limit is reached, and then the AL8862 enters hiccup mode. When the current limit is reached, SW is turned off with inductor current going down, and SW is turned on again after 55us. Then inductor current goes up until 3A current limit is reached, and the cycle repeats. If the current limit is reached for accumulated 8 times, the AL8862 is latched off. Only a power cycle of V_{IN} can reset the AL8862.

Figure 3. System Start up with Sense Resistor Short-circuit
