# Amorphous Silicon Solar Cells **Amorphous Photosensors**

The development of the solar cell is progressing with rapid speed. As a new energy tool which can effectively harness the amazing power of sunlight, solar cells have the potential to replace fossil fuels as our main means of power generation. Solar energy is both a clean and inexhaustible resource, and it can be used to produce electricity wherever and whenever sunlight is available. Of these technologies, amorphous silicon solar cells have many strengths that surpass those of the earlier crystalline silicon solar cells. In addition, they require little energy to manufacture and use less raw materials, and thus are truly environmentally friendly devices. This technology also allows larger area cells to be manufactured and can take advantage of the flexibility of thin film materials, and they have already been used in a wide range of applications. SANYO was one of the first companies to focus on amorphous silicon solar cells, and developed and is now mass producing the Amorton integrated type amorphous silicon solar cells that feature a new device structure.

Amorion

### **The Concept Behind Solar Cell Power Generation**

Solar cell power is generated using the photovoltaic effect of semiconductors. When a semiconductor is exposed to a light source of suitable intensity, a large number of pairs of an electron and a positive hole are generated as a result of the reciprocal action between photons and silicon atoms.

At a p/n junction between two different semiconductor materials, the electrons are diffused in the n-type material and the positive holes are scattered in the p-type material. They are then collected at both electrodes respectively, resulting in a voltage difference between the electrodes.

When an external load is connected, electricity flows through the load. In this way, an a-Si solar cell converts light energy into electricity and supplies power to external loads.

### **Amorphous Silicon Solar Cells**

Solar cells are classified according to the material employed, i.e., crystal silicon, amorphous silicon, and compound semiconductor solar cells. "Amorphous" refers to objects having no definite shape and is defined as non-crystal material.

Unlike crystal silicon, in which atomic arrangements are regular, amorphous silicon features irregular atomic arrangements as shown in the figures below. As a result, the reciprocal action between photons and silicon atoms occurs more frequently in amorphous silicon than in crystal silicon, allowing much more light to be absorbed. Thus, an ultra-thin amorphous silicon film of less than 1µm can be produced and used for power generation. Also, by utilizing metal or plastics for the substrate, flexible solar cells can be produced. Amorton is an integrated amorphous silicon solar cell which has been developed by SANYO. Amorton uses silane (SiH4) as its source gas and is fabricated using a plasma CVD method. Three amorphous silicon layers æ p-layer, i-layer, and n-layer æ are formed consecutively on a glass substrate. This p-i-n junction corresponds to the p/n junction of a crystal silicon solar cell. In the process of this junction formation, a number of cells are connected in series on a substrate at one time. This allows any desired voltage to be obtained for a variety of equipment operation.

### **Features of Amorton**

Place used	Substrate	Feature	Reference
	Glass	Low price (basic substrate)	Page 5
Indoors	Stainless steel	Thin, light weight, unbreakable, can easily be formed in arbitrary shapes, highly precise dimensions	Contact your SANYO representative.
	Film	Thin, light weight, unbreakable, bendable, can easily be formed in arbitrary shapes	Contact your SANYO representative.
•	Glass	Low price (basic substrate)	Page 5
Outdoors	Stainless steel	Thin, light weight, unbreakable, can easily be formed in arbitrary shapes, highly precise dimensions	Contact your SANYO representative.
	Film	Thin, light weight, unbreakable, bendable, can easily be formed in arbitrary shapes	Page 6
Visible light sensor		Support designs with arbitrary sizes and patterns as required by the application	Page 9

### n Relationship between illumination level and output

The figure shows the relationship between illumination level and output. There is an enormous difference between the illumination levels indoors and outdoors. SANYO provides two types of products, indoor products for use in the low illumination levels common in indoor environments and outdoor products for the high illumination levels common outdoors.

#### n Relationships between number of rows of the cell and cell area (Illumination level is constant.)

- n Solar cells with a variety of voltages can be created create batteries with a variety of voltages. (This series connection idea is the same as that used with regular batteries.)
- n Solar cells with a variety of shapes can be created bent, can be created.

It is also possible to create areas in these solar cells that consist of just transparent glass by etching.

n High sensitivity in the visible light region The human eye is sensitive to light with wavelengths from about 400 nm to 700 nm. to solar cells, they can also be used as visible light sensors.

Amorton

Since, unlike the fabrication technique used with crystalline solar cells in which cells cut apart and then connected, multiple cells can be connected in series at the same time as the cells are formed, it is easy to

The methods used to form amorphous films have special features that allow other substrates, such as stainless steel or plastic films, to be used in place of the usual glass substrate. This means that previously unknown solar cells, solar cells that are round, square, or any complex shape, or solar cells that can be

Since amorphous silicon solar cells are sensitive to light with essentially the same wavelengths, in addition

## **Amorton Film**

Amorton Film is an exceptionally thin, light and flexible amorphous silicon solar cell fabricated on plastic film.

In addition to these advantages, Amorton Film is also resistant to crack. Its standard configuration includes protective film covering the amorphous silicon solar cell which measures about 0.4mm in overall thickness.

SANYO Amorton products are widely used in solar watches.

SANYO can provide custom Amorton products to match the shape of the watch (watch face characters or special designs).

SANYO can provide evaluation samples in each of the different substrates. Contact your SANYO representative for consultation.

## **Features of Amorton**

The features of Amorton are shown by the current-voltage curve in the figure.

The curve changes depending on the incident light intensity and the surrounding temperature.

### **Output Characteristics**

n Output Characteristics of Indoor use Amorton Artificial light, such as fluorescent and incandescent light, is used indoors. The illuminance of these light sources ranges from 20 lux to 1,000 lux. Indoors, therefore, Amorton is most suitable for small equipment such as electronic calculators. Please use under 1,000 lux.

Typical Cell Characteristics (25°C)						
Open-circuit voltage Short-circuit current Maximum Light source						
0.63 V/cell	17.0µA/cm2	7.0µW/cm <sup>2</sup>	FL200lux

## **Features of Amorton Photosensors**

Amorphous Photosensor is a kind of Photo Diode, and can detect light and its intensity.

**Spectral Sensitivity of Amorphous Photosensor** 

#### High Sensitivity detection within the visible-light spectrum

Human eyes are sensitive to the light wavelength ranging from approximately 400nm to 700nm.

Amorphous photosensors have sensitivity in the same range and provide light sensing capability similar to human eyes.

**Dependence of Isc Characteristics on Illumination** 

#### Output current is proportional to illumination

Accurate light detection is possible because output current increases proportionally to the illuminance.

Shape Example

#### Flexibility in pattern shaping or sizing

Amorphous photosensors provide flexible designing in size and shape to fit your needs.

## Amorton Photosensors Circuit Diagram Example

OP amplifier detects photosensor output current and convert to voltage. The signal is linearly amplified.

## Amorton Photosensors Application Example

The following shows typical applications of amorphous photosensors

Amorton

# Solar Cell Output and Light Sources

The output of solar cells differ depending on the categories of light sources to which they are exposed. This is because photoelectric conversion efficiency changes with respect to the wavelength and intensity of the light.

#### 1. Categories of light sources

The general light source for solar cells is sunlight out of doors, and fluorescent or incandescent light indoors. The following outline describes the various categories:

	Light	source	
	Sunlight		Artificial light
AM-0	Outer space (solar light at global average revolution orbit)	Incandescent light	General-use incandescent light, halogen lamp
AM-1	When the sun is directly overhead (0m above sea level at the equator, vertical sunlight at meridian passage)	Fluorescent light	Daylight, white, and warm white colors
AM-1.5	When zenithal angle (Sunlight angle 0° when sun is directly overhead) is 48.2°.	Electric discharge lamp	Mercury-vapor lamp, sodium-vapor lamp, xenon lamp
Other	AM-2 (when zenithal angle is 60°), etc.		

#### 2. Brightness

When sunlight and fluorescent light are compared in terms of brightness, the results are shown as follows:

[Light Source]	Sunlight		Fluorescent light
Condition	Illuminance (lux)	Condition	Illuminance (lux)
Direct sun	100,000 to 120,000	Design stand (partially illuminated)	Around 1,000
Bright	50,000 to 100,000	Office/conference room	300 to 600
Cloudy	10,000 to 50,000	Restaurants/coffee shops	Below 200
Rain	5,000 to 20,000		

### 3. Radiant spectrum of light source and spectral sensitivity of solar cells

Amorton
