

## Description

The AP2141 and AP2151 are integrated high-side power switches optimized for Universal Serial Bus (USB) and other hot-swap applications. This family of devices complies with USB 2.0 and is available with both polarities of Enable input. They offer current and thermal limiting and short circuit protection as well as controlled rise time and undervoltage lockout functionality. A 7ms deglitch capability on the open-drain Flag output prevents false over-current reporting and does not require any external components.

All devices are available in SO-8, MSOP-8EP, SOT25, and U-DFN2018-6 packages

## Features

- Single USB Port Power Switches
- Over-Current and Thermal Protection
- 0.8A Accurate Current Limiting
- Reverse Current Blocking
- 95mΩ On-Resistance
- Input Voltage Range: 2.7V - 5.5V
- 0.6ms Typical Rise Time
- Very Low Shutdown Current: 1μA (max)
- Fault Report (FLG) with Blanking Time (7ms typ)
- ESD Protection: 4kV HBM, 400V MM
- Active High (AP2151) or Active Low (AP2141) Enable
- Ambient Temperature Range -40°C to +85°C
- SOT25, SO-8, MSOP-8EP (Exposed Pad), and U-DFN2018-6: Available in "Green" Molding Compound (No Br, Sb)
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green" Device (Note 3)**
- 15kV ESD Protection per IEC 61000-4-2 (with external capacitance)
- UL Recognized, File Number E322375
- IEC60950-1 CB Scheme Certified

## Applications

- Consumer Electronics – LCD TV & Monitor, Game Machines
- Communications – Set-Top Box, GPS, Smartphone
- Computing – Laptop, Desktop, Servers, Printers, Docking Station, HUB

- Notes:
1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS) & 2011/65/EU (RoHS 2) compliant.
  2. See [http://www.diodes.com/quality/lead\\_free.html](http://www.diodes.com/quality/lead_free.html) for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
  3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

## Pin Assignments

**Typical Applications Circuit**

**Available Options**

Part Number	Channel	Enable Pin (EN)	Current Limit (typical)	Recommended Maximum Continuous Load Current
AP2141	1	Active Low	0.8A	0.5A
AP2151	1	Active High	0.8A	0.5A

**Pin Descriptions**

Pin Name	Pin Number				Function
	SO-8	MSOP-8EP	SOT25	U-DFN2018-6	
GND	1	1	2	1	Ground
IN	2, 3	2, 3	5	2	Voltage Input Pin (all IN pins must be tied together externally)
EN	4	4	4	3	Enable Input Active Low (AP2141) or Active High (AP2151).
FLG	5	5	3	4	Over-Current and Over-Temperature Fault Report Open-Drain flag is active low when triggered
OUT	6, 7	6, 7	1	5, 6	Voltage Output Pin (all OUT pins must be tied together externally)
NC	8	8	N/A	N/A	No internal connection; recommend tie to OUT pins
Exposed Pad	—	Exposed Pad	—	Exposed Pad	Exposed Pad It should be externally connected to GND plane and thermal mass for enhanced thermal impedance. It should not be used as electrical ground conduction path.

**Functional Block Diagram**

**Absolute Maximum Ratings** (@T<sub>A</sub> = +25°C, unless otherwise specified.)

Symbol	Parameter		Ratings	Units	
ESD	HBM	Human Body Model ESD Protection	4	kV	
	MM	Machine Model ESD Protection for SO-8,MSOP-8EP, SOT25 packages	400	V	
	MM	Machine Model ESD Protection for U-DFN2018-6, SO-8 packages	300	V	
	IEC system level	Surges per EN61000-4-2. 1999 applied to output terminals of EVM (Note 5)	Air	15	kV
		Surges per EN61000-4-2. 1999 applied to output terminals of EVM (Note 5)	Contact	8	kV
V <sub>IN</sub>	Input Voltage		6.5	V	
V <sub>OUT</sub>	Output Voltage		V <sub>IN</sub> +0.3	V	
V <sub>EN</sub> , V <sub>FLG</sub>	Enable Voltage		6.5	V	
I <sub>LOAD</sub>	Maximum Continuous Load Current		Internal Limited	A	
T <sub>J(MAX)</sub>	Maximum Junction Temperature		150	°C	
T <sub>ST</sub>	Storage Temperature Range (Note 4)		-65 to +150	°C	

Caution: Stresses greater than the 'Absolute Maximum Ratings' specified above, may cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions exceeding those indicated in this specification is not implied. Device reliability may be affected by exposure to absolute maximum rating conditions for extended periods of time.

Semiconductor devices are ESD sensitive and may be damaged by exposure to ESD events. Suitable ESD precautions should be taken when handling and transporting these devices

- Notes: 4. UL Recognized Rating from -30°C to +70°C (Diodes qualified T<sub>ST</sub> from -65°C to +150°C).  
5. External capacitors need to be connected to the output, EVM board tested with capacitor 2.2µF 50V 0805. This level is a pass test only and not a limit.

**Recommended Operating Conditions** (@T<sub>A</sub> = +25°C, unless otherwise specified.)

Symbol	Parameter	Min	Max	Units
V <sub>IN</sub>	Input voltage	2.7	5.5	V
I <sub>OUT</sub>	Output Current	0	500	mA
T <sub>A</sub>	Operating Ambient Temperature	-40	+85	°C
V <sub>IL</sub>	EN Input Logic Low Voltage	0	0.8	V
V <sub>IH</sub>	EN Input Logic High Voltage	2	V <sub>IN</sub>	V

**Electrical Characteristics** (@ $T_A = +25^\circ\text{C}$ ,  $V_{IN} = +5.0\text{V}$ , unless otherwise specified.)

## Application Information

### Power Supply Considerations

A 0.01- $\mu$ F to 0.1- $\mu$ F X7R or X5R ceramic bypass capacitor between IN and GND, close to the device, is recommended. Placing a high-value electrolytic capacitor on the input (10- $\mu$ F minimum) and output pin(s) is recommended when the output load is heavy. This precaution reduces power-supply transients that may cause ringing on the input. Additionally, bypassing the output with a 0.01- $\mu$ F to 0.1- $\mu$ F ceramic capacitor improves the immunity of the device to short-circuit transients.

### Over-current and Short Circuit Protection

An internal sensing FET is employed to check for over-current conditions. Unlike current-sense resistors, sense FETs do not increase the series resistance of the current path. When an overcurrent condition is detected, the device maintains a constant output current and reduces the output voltage accordingly. Complete shutdown occurs only if the fault stays long enough to activate thermal limiting.

Three possible overload conditions can occur. In the first condition, the output has been shorted to GND before the device is enabled or before  $V_{IN}$  has been applied. The AP2141/AP2151 senses the short circuit and immediately clamps output current to a certain safe level namely  $I_{LIMIT}$ .

In the second condition, an output short or an overload occurs while the device is enabled. At the instance the overload occurs, higher current may flow for a very short period of time before the current limit function can react. After the current limit function has tripped (reached the over-current trip threshold), the device switches into current limiting mode and the current is clamped at  $I_{LIMIT}$ .

In the third condition, the load has been gradually increased beyond the recommended operating current. The current is permitted to rise until the current-limit threshold ( $I_{TRIP}$ ) is reached or until the thermal limit of the device is exceeded. The AP2141/AP2151 is capable of delivering current up to the current-limit threshold without damaging the device. Once the threshold has been reached, the device switches into its current limiting mode and is set at  $I_{LIMIT}$ .

Note that when the output has been shorted to GND at extremely low temperature ( $< -30^{\circ}\text{C}$ ), a minimum 120- $\mu$ F electrolytic capacitor on the output pin is recommended. A correct capacitor type with capacitor voltage rating and temperature characteristics must be properly chosen so that capacitance value does not drop too low at the extremely low temperature operation. A recommended capacitor should have temperature characteristics of less than 10% variation of capacitance change when operated at extremely low temp. Our recommended aluminum electrolytic capacitor type is Panasonic FC series.

### FLG Response

When an over-current or over-temperature shutdown condition is encountered, the FLG open-drain output goes active low after a nominal 7-ms deglitch timeout. The FLG output remains low until both over-current and over-temperature conditions are removed. Connecting a heavy capacitive load to the output of the device can cause a momentary over-current condition, which does not trigger the FLG due to the 7-ms deglitch timeout. The AP2141/AP2151 is designed to eliminate false over-current reporting without the need of external components to remove unwanted pulses.

### Power Dissipation and Junction Temperature

The low on-resistance of the internal MOSFET allows the small surface-mount packages to pass large current. Using the maximum operating ambient temperature ( $T_A$ ) and  $R_{DS(ON)}$ , the power dissipation can be calculated by:

$$P_D = R_{DS(ON)} \times I^2$$

Finally, calculate the junction temperature:

$$T_J = P_D \times R_{\theta JA} + T_A$$

Where:

$T_A$  = Ambient temperature  $^{\circ}\text{C}$

$R_{\theta JA}$  = Thermal resistance

$P_D$  = Total power dissipation

**Application Information** (cont.)

**Thermal Protection**

Thermal protection prevents the IC from damage when heavy-overload or short-circuit faults are present for extended periods of time. The AP2141/AP2151 implements a thermal sensing to monitor the operating junction temperature of the power distribution switch. Once the die temperature rises to approximately +140°C due to excessive power dissipation in an over-current or short-circuit condition, the internal thermal sense circuitry turns the power switch off, thus preventing the power switch from damage. Hysteresis is built into the thermal sense circuit allowing the device to cool down approximately 25°C before the switch turns back on. The switch continues to cycle in this manner until the load fault or input power is removed. The FLG open-drain output is asserted when an over-temperature shutdown or over-current occurs with 7-ms deglitch.

**Under-Voltage Lockout (UVLO)**

Undervoltage lockout function (UVLO) keeps the internal power switch from being turned on until the power supply has reached at least 1.9V, even if the switch is enabled. Whenever the input voltage falls below approximately 1.9V, the power switch is quickly turned off. This facilitates the design of hot-insertion systems where it is not possible to turn off the power switch before input power is removed.

**Host/Self-Powered HUBs**

Hosts and self-powered hubs (SPH) have a local power supply that powers the embedded functions and the downstream ports (see Figure 2). This power supply must provide from 5.25V to 4.75V to the board side of the downstream connection under both full-load and no-load conditions. Hosts and SPHs are required to have current-limit protection and must report over-current conditions to the USB controller. Typical SPHs are desktop PCs, monitors, printers, and stand-alone hubs.

**Figure 2 Typical One-Port USB Host / Self-Powered Hub**

**Generic Hot-Plug Applications**

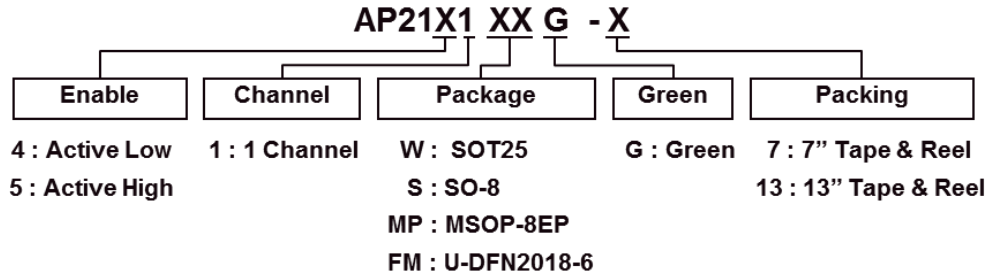

In many applications it may be necessary to remove modules or PC boards while the main unit is still operating. These are considered hot-plug applications. Such implementations require the control of current surges seen by the main power supply and the card being inserted. The most effective way to control these surges is to limit and slowly ramp the current and voltage being applied to the card, similar to the way in which a power supply normally turns on. Due to the controlled rise and fall times of the AP2141/AP2151, these devices can be used to provide a softer start-up to devices being hot-plugged into a powered system. The UVLO feature of the AP2141/AP2151 also ensures that the switch is off after the card has been removed, and that the switch is off during the next insertion.

By placing the AP2141/AP2151 between the  $V_{CC}$  input and the rest of the circuitry, the input power reaches these devices first after insertion. The typical rise time of the switch is approximately 1ms, providing a slow voltage ramp at the output of the device. This implementation controls system surge current and provides a hot-plugging mechanism for any device.

**Dual-Purpose Port Applications**

AP2141/AP2151 is not recommended for use in dual-purpose port applications in which a single port is used for data communication between the host and peripheral devices while simultaneously maintaining a charge to the battery of the peripheral device. An example of such a non-recommended application is a shared HDMI/MHL (Mobile High-definition Link) port that allows streaming video between an HDTV or set-top box and a smartphone or tablet while maintaining a charge to the smartphone or tablet battery. If a voltage is maintained across the output of the AP2141/AP2151 when the output is disabled and the  $V_{in}$  of the device is subsequently ramped up, an overstress condition to the AP2141/AP2151 may result.
