

Radiation Hardened 5-channel Bus Transceiver with cold sparing

1 GENERAL DESCRIPTION

The AP54RHC506 is a radiation-hardened by design 5-bit bus transceiver with 3-state outputs that is ideally suited for space, medical imaging and other applications demanding radiation tolerance and high reliability. It is fabricated in a 180 nm CMOS process utilizing proprietary radiation-hardening techniques, delivering high resiliency to single-event effects (SEE) and to a total ionizing dose (TID) up to 30 krad (Si).

This device is a member of the Apogee Semiconductor AP54RHC logic family operating across a voltage supply range of 1.65 V to 5.5 V.

An output enable control pin allows all buffers to be placed in a high impedance (high-Z) state, simplifying usage in applications with shared busses or mixed power domains. A direction control pin is used to determine whether data flow is $A \rightarrow B$ or $B \rightarrow A$.

Zero-power penalty™ cold-sparing is supported, along with Class 2 ESD protection on all inputs and outputs. A proprietary output stage and robust power-on reset (POR) circuit allow the AP54RHC506 to be cold-spared in any redundant configuration with no static power loss on any pad of the device. The redundant output stage also features a high drive capability with low static power loss.

The AP54RHC506 also features a triple-redundant design throughout its entire circuitry, which allows it to be immune to single-event transients (SET) without requiring additional redundant devices.

Ordering information may be found in Table 9 on Page 12.

1.1 FEATURES

- 1.65 VDC to 5.5 VDC operation
- Inputs tolerant up to 5.5 VDC at any V_{CC}
- Provides logic-level down translation to V_{CC}

- Extended operating temperature range (-55 °C to +125 °C)
- Proprietary cold-sparing capability with zero static power penalty
- Built-in triple redundancy for enhanced reliability
- Internal power-on reset (POR) circuitry ensures reliable power up and power down responses during hot plug and cold sparing operations
- Tri-state output drivers
- Class 2 ESD protection (4000 V HBM, 500 V CDM)
- TID resilience of 30 krad (Si)
- SEL resilient up to LET of 80 MeV-cm²/mg

5 ELECTRICAL CHARACTERISTICS

The sign convention for current follows JEDEC standards with negative values representing current sourced from the device and positive values representing current sunk into the device.

5.1 ABSOLUTE MAXIMUM RATINGS

Excursions beyond the values listed in Table 3 may cause permanent damage to the device. Proper function of the device cannot be guaranteed if these values are exceeded, and long-term device reliability may be affected. Functionality of the device at these values, or beyond those listed in Recommended Operating Conditions (Table 4) is not guaranteed.

All parameters are specified across the entire operating temperature range unless otherwise specified.

Table 3: Absolute Maximum Ratings

with cold sparing

6 DETAILED DESCRIPTION

The AP54RHC506 is a 5-bit bus transceiver with 3-state outputs intended to perform the Boolean function **BUFF** (Y = A) in positive logic. Designed to operate from a wide supply voltage of 1.65 to 5.5 V, it has fully redundant input and output stages providing for superior resiliency to single event effects.

The output and input stages are constructed with transient activated clamps (Figure 6, 7) that prevent inadvertent biasing of the V_{CC} power rail through parasitic diodes inherent to conventional input, output, and ESD circuits. The IC also incorporates an internal power-on reset (POR) circuit that prevents the output from driving erroneous results during power-on, and guarantees correct operation at power supply voltages as low as 1.65 V. While the supply is ramping, the POR holds the output buffer in tri-state, a feature that prevents unwanted DC current during cold sparing on input and output pins.

The AP54RHC family's I/O protection circuitry allows for cold sparing configurations as it avoids a leakage current penalty on inputs and outputs while in a power-down state. This can result in considerable power savings in systems where multiple-path redundancy is employed. The ESD clamp circuits for this logic family are designed to support Class 2 ESD levels of 4 kV HBM and 500 V CDM.

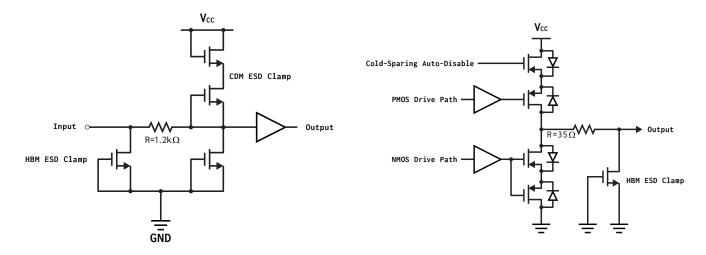

Figure 6: Details of input pin structure

Figure 7: Details of output pin structure

REVISED: 2021-07-30

DOC ID: 601-000-028-A04 (SUBMIT DOCUMENTATION FEEDBACK)

7 APPLICATIONS INFORMATION

7.1 USE IN COLD-SPARING CONFIGURATION

As the AP54RHC family is radiation-hardened by design and includes internal TMR, it can be utilized in high-reliablity applications without additional supporting circuitry or devices. Nonetheless, some application requirements call for fully-redundant designs, where an "A" and a "B" device are required, often on separate power rails.

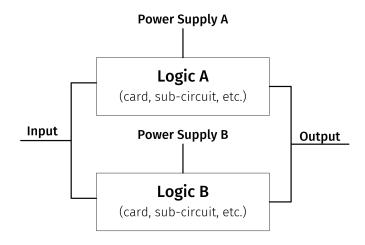

Figure 8: Two-path cold-sparing configuration.

With the cold-sparing capability of the AP54RHC family, fully redundant "A" and "B" functions may be placed in parallel (as seen in Figure 8) running off redundant power supplies. The inputs and outputs on each one of these functions are assumed to be based on the AP54RHC family, allowing for direct parallel connection without unwanted leakage current paths during cold sparing. In the event of a failure in power supply A or within function A, the system can simply shut power supply A off and switch on power supply B, without requiring additional input or output switching or configuration changes.

7.2 POWER SUPPLY RECOMMENDATIONS

This device can operate at any voltage within the range specified in Table 4 Recommended Operating Conditions.

At a minimum, a 16 VDC (or higher), X7R-rated 0.1 μ F ceramic decoupling capacitor should be placed near (within 1 cm) the V_{CC} pin of the device.

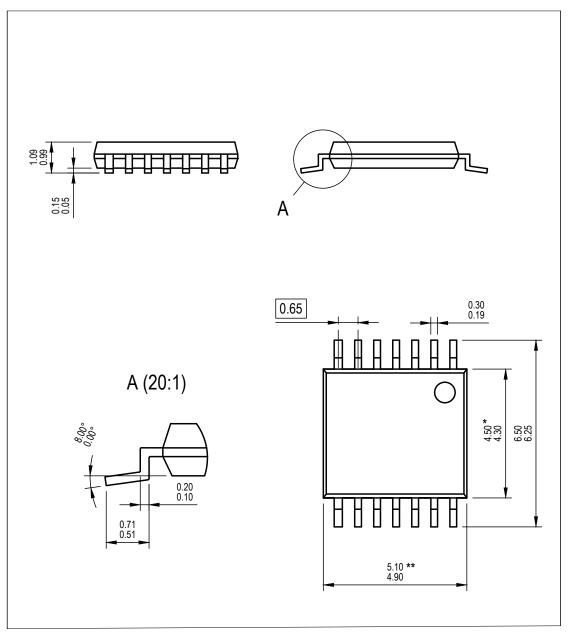

7.3 APPLICATION TIPS

Unused **inputs** must **not** be left floating. They may be connected to either a low (GND) or high (V_{CC}) bias to provide a known state at the input of the device. Resistors may be used to tie off unused inputs. In the event of a design change, such resistors can be removed, thereby allowing use of the inputs without having to cut traces on the PCB.

An unused **output** may be left floating. It is suggested that it be routed to a test point or similar accessible structure in case the gate needs to be utilized as part of a design revision.

8 PACKAGING INFORMATION

Notes

- 1. All linear dimensions are in millimeters. Dimensioning and tolerancing are as per ISO/TS 128-71:2010 2. The part is compliant with JEDEC MO-153 specifications.
- * Body width does **not** include interlead flash. Interlead flash shall not exceed 0.25 mm each side.
- ** Body length does **not** include mold flash, protrusion, or gate burrs. Mold flash, protrusions, and gate burrs shall not exceed 0.15 mm on each side.
