## 2 Introduction

This Pseudo-SRAM device features a high speed, low pin count interface. It has 4 I/O pins and operates in SPI(serial peripheral interface) or QPI (quad peripheral interface) mode with frequencies up to 144 MHz. The data input (A/DQ) to the memory relies on clock (CLK) to latch all instructions, addresses and data. It is most suitable for low-power and low cost portable applications. It incorporates a seamless self-managed refresh mechanism. Hence it does not require the support of DRAM refresh from system host. The self-refresh feature is a special design to maximize performance of memory read operation.

## 3 Package Information

## 8 Power-Up Initialization

SPI/QPI products include an on-chip voltage sensor used to start the self-initialization process. When  $V_{DD}$  reaches a stable level at or above minimum  $V_{DD}$ , the device will require  $150\mu\text{s}$  and user-issued RESET Operation (see section 17) to complete its self-initialization process. From the beginning of power ramp to the end of the  $150\mu\text{s}$  period, CLK should remain LOW, CE# should remain HIGH (track  $V_{DD}$  within 200mV) and SI/SO/SIO[3:0] should remain LOW.

After the  $150\mu\text{s}$  period the device is ready for normal operation.

### 11.1 Command Termination

All Reads & Writes must be completed by raising CE# high immediately afterwards in order to terminate the active command and set the device into standby. Not doing so will block internal refresh operations and cause memory failure.

Figure 2: Write Command Termination

For a memory controller to correctly latch the last piece of data prior to read termination, it is recommended to provide a longer CE# hold time ( $t_{CHD} > t_{ACLK} + t_{CLK}$ ) for a sufficient data window.

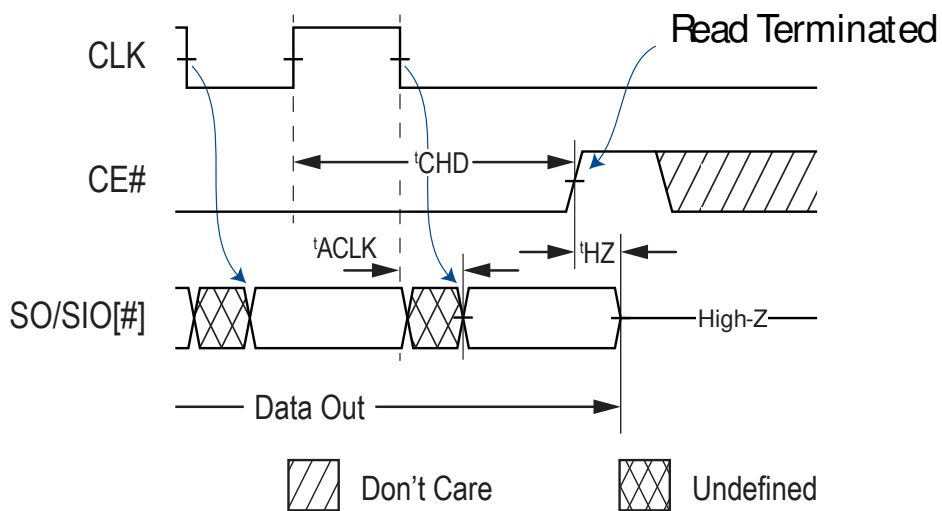

Figure 3: Read Command Termination

## 12 Mode Register Operations

### 12.1 SPI MR Read Operation

For all reads, MR data will be available  $t^{\text{ACLK}}$  after the falling edge of CLK.

Figure 4: SPI MR Read 'hB5'

### 12.2 SPI MR Write Operation

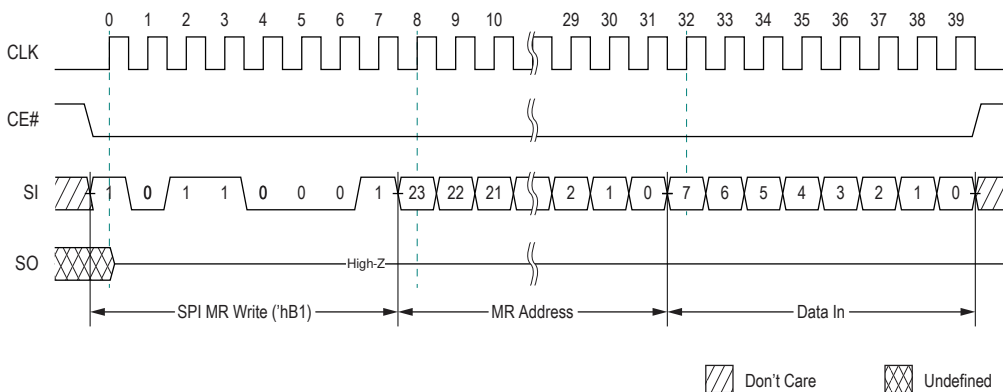

Figure 5: SPI MR Write 'hB1'

### 12.3 QPI MR Read Operation

For all reads, MR data will be available  $t^{\text{ACLK}}$  after the falling edge of CLK.

Figure 6: QPI MR Read 'hB5

### 12.4 QPI MR Write Operation

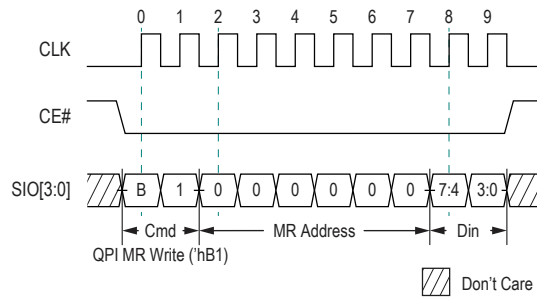

Figure 7: QPI MR Write 'hB1

### 13 Read ID

Read ID command provides information of vendor ID, known-good-die, device density, and manufacturing ID. It can be executed under the following 2 conditions: (Please see the following Figure 8)

1. Run it as the first operation after power up and before any other commands being executed.
2. Issue a memory read command with address = 'h00000 first, then Read ID command.
3. Issue a pre-condition of dummy read id, then Read ID command.

Figure 8: Pre-condition of EID Read

#### 13.1 SPI Read ID Operation

This command is similar to Fast Read, but without the wait cycles and the device outputs EID value instead of data.

Figure 9: SPI Read ID 'h9F (available only in SPI mode)

## 14 Toggle Burst Length Operation

The Toggle Burst Length Operation switches the device's wrapped burst boundary between the Mode Register setting (default of 512 bytes CA[8:0]) and 32 (CA[4:0]) bytes or whatever is set in MR0[6:5] and a fixed value of 32 bytes.

Figure 11: SPI Burst Length Toggle 'hC0

Figure 12: QPI Burst Length Toggle 'hC0

## 15 SPI Mode Operations

The device powers up into SPI mode by default but can also be switched into QPI mode.

### 15.1 SPI Read Operations

For all reads, data will be available  $t^{\text{ACLK}}$  after the falling edge of CLK.

SPI Reads can be done in four ways:

1. 'h03: Serial CMD, Serial Addr/IO, slow frequency
2. 'h0B: Serial CMD, Serial Addr/IO, fast frequency
3. 'hEB: Serial CMD, Quad Addr/IO, fast frequency
4. 'h8B: Serial CMD, Serial Addr/IO, fast frequency

### 15.2 SPI Write Operations

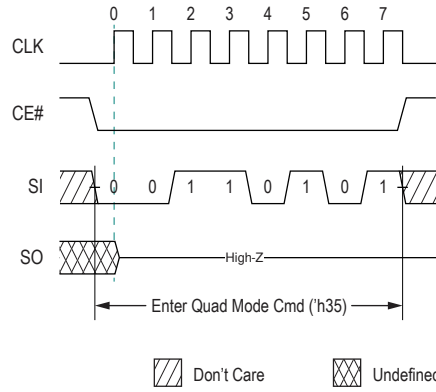

Figure 17: SPI Quad Write 'h38

### 15.3 SPI Quad Mode Enable Operation

This command switches the device into quad IO mode.

**Figure 18: Quad Mode Enable 'h35 (available only in SPI mode)**

## 16 QPI Mode Operations

### 16.1 QPI Read Operations

For all reads, data will be available  $t^*_{\text{ACLK}}$  after the falling edge of CLK.

QPI Reads can be done in one of three ways:

1. 'h0B: Quad CMD, Addr & IO , slow frequency.
2. 'hEB: Quad CMD, Addr & IO, fast frequency.
3. 'h8B: Quad CMD, Addr & IO, fast frequency.

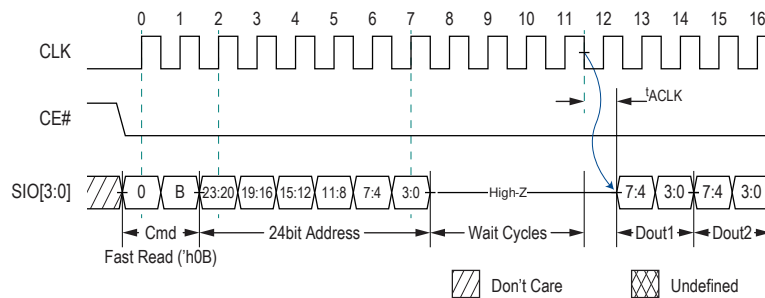

Figure 19: QPI Fast Read 'h0B (max freq 66 MHz)

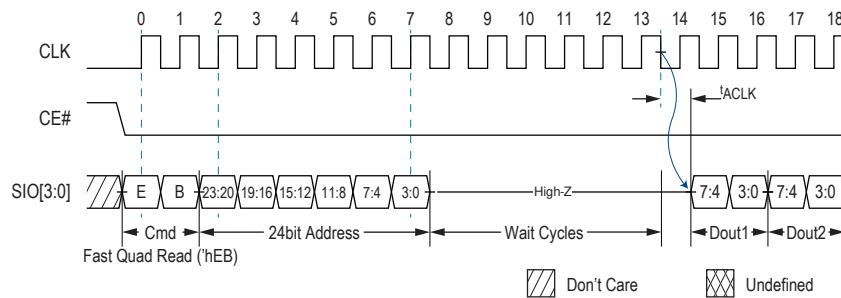

Figure 20: QPI Fast Quad Read 'hEB (max freq 144 MHz)

## 16.2 QPI Write Operation(s)

QPI write command can be done in one of two ways:

1. 'h02 or 'h38: Quad CMD, Addr & IO.
2. 'h82: Quad CMD, Addr & IO.

Figure 21: QPI Write

## 16.3 QPI Quad Mode Exit operation

This command will switch the device back into serial IO mode.

Figure 22: Quad Mode Exit 'hF5 (only available in QPI mode)

## 17 Reset Operation

The Reset operation is used as a system (software) reset that puts the device in SPI standby mode which is also the default mode after power-up. This operation consists of two commands: Reset-Enable (RSTEN) and Reset (RST).

Figure 23: SPI Reset

Figure 24: QPI Reset

Reset command has to immediately follow the Reset-Enable command in order for the reset operation to take effect. Any command other than the Reset command after the Reset-Enable command will cause the device to exit Reset-Enable state and abandon reset operation.

## 19 Electrical Specifications:

### 19.1 Absolute Maximum Ratings

**Table 7: Absolute Maximum Ratings**

Parameter	Symbol	Rating	Unit	Notes
Voltage to any ball except $V_{DD}$ relative to $V_{SS}$	VT	-0.4 to $V_{DD}+0.4$	V	
Voltage on $V_{DD}$ supply relative to $V_{SS}$	$V_{DD}$	-0.4 to +2.45	V	
Storage Temperature	$T_{STG}$	-55 to +150	°C	1

Notes 1: Storage temperature refers to the case surface temperature on the center/top side of the PSRAM.

Caution:

Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

### 19.2 Pin Capacitance

**Table 8: Bare Die Pin Capacitance**

Parameter	Symbol	Min	Max	Unit	Notes

**Table 10: Load Capacitance**

Parameter	Symbol	Min	Max	Unit	Notes
Load Capacitance	$C_L$		15	pF	

Note 1: System  $C_L$  for the use of package

### 19.3 Decoupling Capacitor Requirement

It is required to have a decoupling capacitor on VDD pin for IO switchings and psram internal transient events. A low ESR 1 $\mu$ F ceramic cap is recommended. To minimize parasitic inductance, place the cap as close to VDD pin as possible. An optional 0.1 $\mu$ F can further improve high frequency transient response.

Figure 27: Decoupling Capacitor

Note that the length of grounding connection between PSRAM and PCB must be as short as possible. Having **ground plane on PCB** and **multipoint ground** would be preferred (to avoid single-point grounding topology). The width of VDD and VSS traces would be suggested more than 20mil.

### 19.4 Operating Conditions

Table 11: Operating Characteristics

Parameter	Min	Max	Unit	Notes
Operating Temperature (extended)	-40	105	°C	1
Operating Temperature (standard)	-40(-25*)	85	°C	*varies by package type

Note 1: spec'd temp range of -40 to 105°C is only characterized; test condition will be -32 to 105°C.
