a leap ahead in analog

AS1130
132-LED Cross-Plexing Driver with scrolling Function

1 General Description

The AS1130 is a compact LED driver for 132 single LEDs. The devices can be programmed via an I²C compatible interface.

The AS1130 offers a 12x11 LED-Matrix with 1/12 cycle rate. The required lines to drive all 132 LEDs are reduced to 12 by using the cross-plexing feature optimizing space on the PCB. The whole LED-Matrix driving 132 LEDs can be analog dimmed from 0 to 30mA in 256 steps (8 bit).

Additionally each of the 132 LEDs can be dimmed individually with 8-bit allowing 256 steps of linear dimming. To reduce CPU usage up to 6 frames can be stored with individual time delays between frames to play small animations automatically.

The AS1130 operates from 2.7V to 5.5V and features a very low shutdown and operational current.

The device offers a programmable IRQ pin. Via a register it can be set on what event (CP request, Interface time out, Error-detection, POR, End of Frame or End of Movie) the IRO is triggered.

Also hardware scroll Function is implemented in the AS1130.

The device is available in a ultrasmall 20-pin WL-CSP and an easy to solder 28-pin SSOP package.

2 Key Features

- 1MHz I²C-Compatible Interface
- Open and Shorted LED Error Detection
- 132 LEDs in Dot Matrix
- Low-Power Shutdown Current
- Individual 8-bit LED PWM Control
- 8-bit Analog Brightness Control
- 8-bit Dot Correction for optimize RGB LED Operation
- Programmable IRQ pin
- Scroll Function
- up to 36 Frames Memory for Animations
- up to 6 Frames Memory for PWM sets
- Supply Voltage Range: 2.7V to 5.5V
- Minimum PCB space required
- Available packages:
  - 20-pin WL-CSP
  - 28-pin SSOP (planned)

3 Applications

The AS1130 is ideal for dot matrix displays in mobile phones, personal electronic and toys.

Pin Assignments

Figure 2. Pin Assignments (Top View)

Pin Descriptions

Table 1. Pin Descriptions

Pin Number		Pin Name	Description
20-pin WL-CSP	**28-pin SSOP**		
A3	1, 7, 14, 22, 28	GND	**Ground**
C3	13	RSTN	**Reset Input**. Pull this pin to logic low to reset all control registers (set to default values). For normal operation pull this pin to VDD.
D1	17	ADDR	**I²C Address.** Connect to external resistor for I²C address selection. Up to 8 devices can be connected on one bus. (see Table 6 on page 12)
D2	16	SDA	**Serial-Data I/O**. Open drain digital I/O I²C data pin.
D3	15	SCL	**Serial-Clock Input**
B3	3, 10, 18, 19, 26	VDD	**Positive Supply Voltage**. Connect to a +2.7V to +5.5V supply. Bypass this pin with 10µF capacitance to GND.
D4	12	SYNC	**Synchronization Clock Input or Output.** The SYNC frequency for Input and Output is 1MHz. For SYNC_OUT the frequency can be reduced to 32kHz.
D5	11	IRQ	**Interrupt Request.** Programmable Open drain digital Output. It can be set via an register after which event (Interface Timeout, POK, CP_Request, Error Detection, End of Frame or End of Movie) the pin triggers an Interrupt Request.
A1, A2, A4, A5, B1, B2, B4, B5, C1, C2, C4, C5	25, 27, 2, 4, 23, 24, 5, 6, 21, 20, 9, 8	CS0, CS1, CS6, CS7, CS2, CS3, CS8, CS9, CS4, CS5, CS10, CS11	**Sinks and Sources** for 132 LEDs.

5 Absolute Maximum Ratings

Stresses beyond those listed in Table 2 may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in Section 6 Electrical Characteristics on page 4 is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 2. Absolute Maximum Ratings

Parameter	Min	Max	Units		Comments
Electrical Parameters					
VDD to GND	-0.3	7	V		
All other pins to GND	-0.3	7 or V_{DD} + 0.3	V		
Sink Current		500	mA		
Segment Current		100	mA		
Input Current (latch-up immunity)	-100	100	mA		Norm: JEDEC 78
Electrostatic Discharge					
Electrostatic Discharge HBM		2	kV		Norm: MIL 883 E method 3015
Temperature Ranges and Storage Conditions					
Junction Temperature		+150	ºC		
Storage Temperature Range	-55	+125	ºC		for 20-pin WL-CSP
	-55	+150	ºC		for 28-pin SSOP
Package Body Temperature		+260	ºC		The reflow peak soldering temperature (body temperature) specified is in accordance with *IPC/JEDEC J-STD-020"Moisture/Reflow Sensitivity Classification for Non-Hermetic Solid State Surface Mount Devices".* The lead finish for Pb-free leaded packages is matte tin (100% Sn).
Humidity non-condensing	5	85	%		
Moisture Sensitive Level		1		20-pin WL-CSP	Represents a max. floor life time of unlimited
		3		28-pin SSOP	Represents a max. floor life time of 168h

6 Electrical Characteristics

V_{DD} = 2.7V to 5.5V, typ. values are at T_{AMB} = +25ºC (unless otherwise specified). All limits are guaranteed. The parameters with min and max values are guaranteed with production tests or SQC (Statistical Quality Control) methods.

Table 3. Electrical Characteristics

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
T_{AMB}	Operating Temperature Range			-40		85	°C
T_J	Operating Junction Temperature Range			-40		125	°C
V_{DD}	Operating Supply Voltage			2.7		5.5	V
I_{DD}	Operating Supply Current	All current sources turned ON @ V_{DD} = 5.5V			340		mA
		All current sources turned OFF @ V_{DD} = 5.5V			0.5		
I_{DDSSD}	Software Shutdown Supply Current	All digital inputs at V_{DD} or GND @ V_{DD} = 5.5V			7	15	µA
I_{DDFSD}	Full Shutdown Supply Current	Pin RSTN = 0V, T_{AMB} = +25ºC			0.1	1	µA
I_{DIGIT}	Digit Drive Sink Current (Drive capability of all sources of one digit[1])					360	mA
I_{SEG}	Segment Drive Source Current LED[2]	V_{OUT} = 1.8V to V_{DD}-400mV		28	30	32	mA
ΔI_{SEG}	Segment Drive Current Matching LED				1		%
	Device to Device Current Matching LED	V_{OUT} = 1.8V, V_{DD} = 3.3V			1		%
I_{LEAK}	Leakage Output Current	All current sources OFF, V_{OUT} = 0V, V_{DD} = 5.5V, T_{AMB} = +25ºC			0.005	0.5	µA
ΔI_{LNR}	Line Regulation	V_{OUT} = 1.8V			0.25		%/V
ΔI_{LDR}	Load Regulation	V_{OUT} = 1.8V to V_{DD}-400mV			0.25		%/V
V_{DSSAT}	Saturation Voltage	Current = 30mA, V_{DD} = 3.3V			200		mV
$R_{DSON(N)}$	Resistance for NMOS				0.3	1	Ω
	Open Detection Level Threshold			V_{DD}-0.4	V_{DD}-0.1		V
	Short Detection Level Threshold				770	900	mV
f_{OSC}	Oscillator Frequency			0.9	1	1.1	MHz
$f_{REFRESH}$	Display Scan Rate	12x11 matrix		0.29	0.33	0.36	kHz
t_{RSTN}	Reset Pulse Width Low			500			ns

1. guaranteed by design

2. $I_{SEG} = \dfrac{I_{max} - I_{min}}{I_{max} + I_{min}} \times 100$

Table 4. Logic Inputs/Outputs Characteristics

| Symbol	Parameter	Conditions	Min	Typ	Max	Unit
I_{IH}, I_{IL}	Logic Input Current	V_{IN} = 0V or V_{DD}	-1		1	µA
V_{IH}	CMOS Logic High Input Voltage		0.7 x V_{DD}			V
V_{IL}	CMOS Logic Low Input Voltage				0.3 x V_{DD}	V
ΔV_I	CMOS Hysteresis Voltage			0.3		V
V_{IH}	Mobile Logic High Input Voltage [1]		1.6			V
V_{IL}	Mobile Logic Low Input Voltage [1]				0.6	V
ΔV_I	Hysteresis Voltage [1]			0.1		V
$V_{OL(SDA)}$	SDA Output Low Voltage	I_{SINK} = 3mA			0.4	V
$V_{OL(IRQ)}$	IRQ Output Low Voltage	I_{SINK} = 3mA			0.4	V
$V_{OL(SYNC\_OUT)}$	Sync Clock Output Low Voltage	I_{SINK} = 1mA			0.4	V
$V_{OH(SYNC\_OUT)}$	Sync Clock Output High Voltage	I_{SOURCE} = 1mA			V_{DD}-0.4	V
	Capacitive Load for Each Bus Line				400	pF

1. available on request, See Ordering Information on page 37

Table 5. I²C Timing Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{SCL}	SCL Frequency		100		1000	kHz
t_{BUF}	Bus Free Time Between STOP and START Conditions		1.3			µs
$t_{HOLDSTART}$	Hold Time for Repeated START Condition		260			ns
t_{LOW}	SCL Low Period		500			ns
t_{HIGH}	SCL High Period		260			ns
$t_{SETUPSTART}$	Setup Time for Repeated START Condition		260			ns
$t_{SETUPDATA}$	Data Setup Time		100			ns
$t_{HOLDDATA}$	Data Hold Time				70	ns
$t_{RISE(SCL)}$	SCL Rise Time				120	ns
$t_{RISE(SCL1)}$	SCL Rise Time after Repeated START Condition and After an ACK Bit				120	ns
$t_{FALL(SCL)}$	SCL Fall Time				120	ns
$t_{RISE(SDA)}$	SDA Rise Time				120	ns
$t_{FALL(SDA)}$	SDA Fall Time				120	ns
$t_{SETUPSTOP}$	STOP Condition Setup Time		260			ns
$t_{SPIKESUP}$	Pulse Width of Spike Suppressed				6	ns

Note: The Min / Max values of the Timing Characteristics are guaranteed by design.

8 Detailed Description

Figure 16. AS1130 - Block Diagram
Cross-Plexing Theorem

The cross-plexing theorem is using the fact that a LED has a forward and backward direction. A LED will only glow if there is a current flowing in forward direction. A parallel LED in backward direction will block the current flow. This effect is used in a cross-plexed matrix of LED's.

Each CSx pin (CS0 to CS11) can be switched to VDD via the internal current source ("high"), to GND ("low") or not connected ("highZ").

The mode of operation which is controlled by an internal state machine looks like following. CS0 is switched to GND and all other CSx pins (CS1 to CS11) are controlled according to the settings in the On/Off Frame and Blink & PWM registers (see Table 7 on page 14).

Than CS1 is switched to GND and all other CSx pins (CS0 and CS2 to CS11) are controlled according to the settings in the On/Off Frame and Blink & PWM registers.

In this manner all LEDs in the matrix are scanned and turned on/off depending on the register settings.

I²C Interface

The AS1130 supports the I²C serial bus and data transmission protocol in fast mode at 1MHz. The AS1130 operates as a slave on the I²C bus. The bus must be controlled by a master device that generates the serial clock (SCL), controls the bus access, and generates the START and STOP conditions. Connections to the bus are made via the open-drain I/O pins SCL and SDA.

Figure 17. I²C Interface Initialization

AD2, AD1 and AD0 are defined by the pin ADDR (see I²C Device Address Byte on page 12)
Figure 18. Bus Protocol
The bus protocol (as shown in Figure 18) is defined as:

- Data transfer may be initiated only when the bus is not busy.

- During data transfer, the data line must remain stable whenever the clock line is HIGH. Changes in the data line while the clock line is HIGH will be interpreted as control signals.

The bus conditions are defined as:

- **Bus Not Busy**. Data and clock lines remain HIGH.

- **Start Data Transfer**. A change in the state of the data line, from HIGH to LOW, while the clock is HIGH, defines a START condition.

- **Stop Data Transfe**r. A change in the state of the data line, from LOW to HIGH, while the clock line is HIGH, defines the STOP condition.

- **Data Valid**. The state of the data line represents valid data, when, after a START condition, the data line is stable for the duration of the HIGH period of the clock signal. There is one clock pulse per bit of data. Each data transfer is initiated with a START condition and terminated with a STOP condition. The number of data bytes transferred between START and STOP conditions is not limited and is determined by the master device. The information is transferred byte-wise and each receiver acknowledges with a ninth-bit. Within the I²C bus specifications a high-speed mode (3.4MHz clock rate) is defined.

- **Acknowledge**: Each receiving device, when addressed, is obliged to generate an acknowledge after the reception of each byte. The master device must generate an extra clock pulse that is associated with this acknowledge bit. A device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge clock pulse. Of course, setup and hold times must be taken into account. A master must signal an end of data to the slave by not generating an acknowledge bit on the last byte that has been clocked out of the slave. In this case, the slave must leave the data line HIGH to enable the master to generate the STOP condition.

- Figure 18 on page 10 details how data transfer is accomplished on the I²C bus. Depending upon the state of the R/$\overline{W}$ bit, two types of data transfer are possible:

- **Master Transmitter to Slave Receiver**. The first byte transmitted by the master is the slave address, followed by a number of data bytes. The slave returns an acknowledge bit after the slave address and each received byte.

- **Slave Transmitter to Master Receiver**. The first byte, the slave address, is transmitted by the master. The slave then returns an acknowledge bit. Next, a number of data bytes are transmitted by the slave to the master. The master returns an acknowledge bit after all received bytes other than the last byte. At the end of the last received byte, a not-acknowledge is returned. The master device generates all of the serial clock pulses and the START and STOP conditions. A transfer is ended with a STOP condition or a repeated START condition. Since a repeated START condition is also the beginning of the next serial transfer, the bus will not be released.

The AS1130 can operate in the following slave modes:

- **Slave Receiver Mode**. Serial data and clock are received through SDA and SCL. After each byte is received, an acknowledge bit is transmitted. START and STOP conditions are recognized as the beginning and end of a serial transfer. Address recognition is performed by hardware after reception of the slave address and direction bit.

- **Slave Transmitter Mode**. The first byte (the slave address) is received and handled as in the slave receiver mode. However, in this mode the direction bit will indicate that the transfer direction is reversed. Serial data is transmitted on SDA by the AS1130 while the serial clock is input on SCL. START and STOP conditions are recognized as the beginning and end of a serial transfer.

Command Byte

The AS1130 operation, (see Table 13 on page 20) is determined by a command byte (see Table 19).

Figure 19. Command Byte
Figure 20. Command and Single Data Byte received by AS1130
Figure 21. Setting the Pointer to a Address Register to select a Data Register for a Read Operation
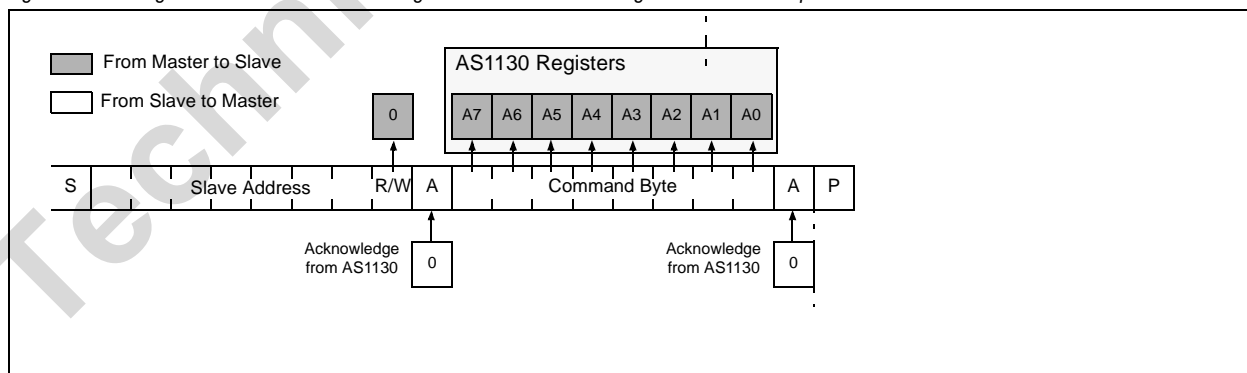

Figure 22. Reading n Bytes from AS1130
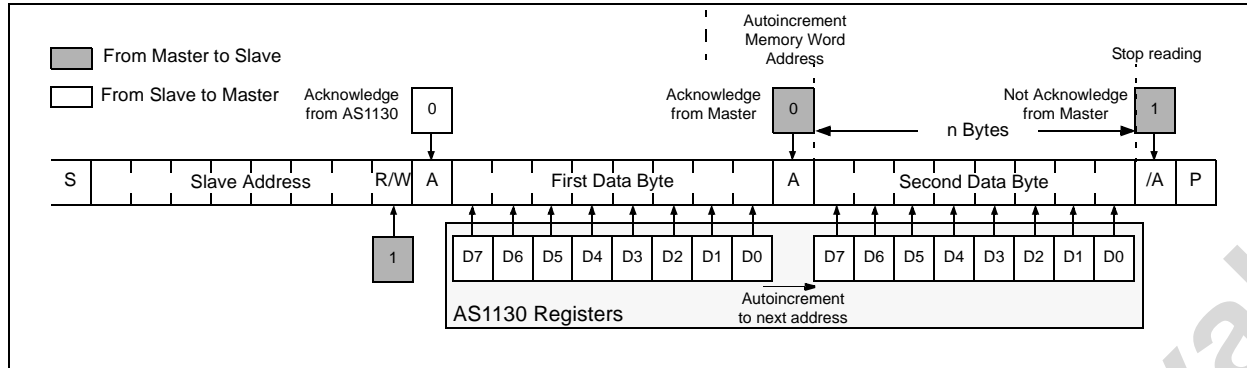

I²C Device Address Byte

The address byte (see Figure 23) is the first byte received following the START condition from the master device.

Figure 23. I²C Device Address Byte

	MSB	6	5	4	3	2	1	LSB
address:	0	1	1	0*	AD2	AD1	AD0	R/$\overline{\text{W}}$

*) can be factory set to 1
- The bit 1, 2 and 3 of the address byte are defined through the resistor @ the device select pin ADDR (see Table 6 on page 12). A maximum of 8 devices with the same pre-set code can be connected on the same bus at one time.

- The last bit of the address byte (R/$\overline{\text{W}}$) define the operation to be performed. When set to a 1 a read operation is selected; when set to a 0 a write operation is selected.

- I²C Common address. All devices are responding on the address "0111111" if the function is enabled in the register AS1130 Config Register (0x06) on page 25.

Following the START condition, the AS1130 monitors the I²C bus, checking the device type identifier being transmitted. Upon receiving the address code, and the R/$\overline{\text{W}}$ bit, the slave device outputs an acknowledge signal on the SDA line.

Table 6. Device Address

I2C Address				
Bit	**Bit Name**	**Default**	**Access**	**Description**
3:1	i2c_addr	000	R	Defines the I²C address of one device via an external resistor on pin ADDR **000:** 1MΩ or floating **001:** 470kΩ **010:** 220kΩ **011:** 100kΩ **100:** 47kΩ **101:** 22kΩ **110:** 10kΩ **111:** 4.7kΩ or GND

The pin ADDR is scanned after start up (POR) and defines the address for the device. The device reacts to this address until a hardware reset (low on pin RSTN) is performed or the power-on-reset (POR) triggers again.

Note: The internal address decoder needs 5ms to identify the address and to set up the device for this address.

Initial Power-Up

On initial power-up, the AS1130 registers are reset to their default values, the display is blanked, and the device goes into shutdown mode. At this time, all registers should be programmed for normal operation. To bring the device into normal operation the following sequence needs to be performed.

Start-up sequence:

- Power-up the AS1130 (connect VDD to a source), the devices is in shutdown;
- After 5ms the address of the AS1130 is valid and the first I²C command can be send.
- Define RAM Configuration; bit mem_conf in the AS1130 Config Register (see Table 20 on page 25)
    - On/Off Frames
    - Blink & PWM Sets
    - Dot Correction, if specified
- Define Control Register (see Table 13 on page 20)
    - Current Source
    - Display options
    - Display picture / play movie
- To light up the LEDs set the shdn bit to '1' for normal operation mode (see Table 23 on page 26).

Shutdown Mode

The AS1130 device features two different shutdown modes. A software shutdown via shutdown register (see Shutdown & Open/Short Register Format on page 26) and a hardware shutdown via the RSTN pin.

The software shutdown disables all LED's and stops the internal operation of the logic. A shutdown mode via the RSTN pin additionally powers down the power-on-reset (POR) of the device. In this shutdown mode the AS1130 consumes only 100nA (typ.).

9 Register Description

Register Selection

Within this register the access to one of the RAM sections, the Dot Correction or to the Control register is selected. After one section is selected this section is valid as long as an other section is selected.

Table 7. Register Selection Address Map

Register Section	Address										Data									Description
	HEX	A7	A6	A5	A4	A3	A2	A1	A0	HEX	D7	D6	D5	D4	D3	D2	D1	D0	
NOP										0x00	0	0	0	0	0	0	0	0	No operation
On/Off Frame 0										0x01	0	0	0	0	0	0	0	1	On/Off Information for each Frame (up to 36 Frames)
On/Off Frame 1										0x02	0	0	0	0	0	0	1	0	
On/Off Frame 2										0x03	0	0	0	0	0	0	1	1	
.....										.....									
On/Off Frame 34										0x23	0	0	1	0	0	0	1	1	
On/Off Frame 35										0x24	0	0	1	0	0	1	0	0	
Blink & PWM Set 0	0xFD	1	1	1	1	1	1	0	1	0x40	0	1	0	0	0	0	0	0	Blink & PWM Information Sets (up to 6 sets)

Blink & PWM Set 2										0x42	0	1	0	0	0	0	1	0	
Blink & PWM Set 3										0x43	0	1	0	0	0	0	1	1	
Blink & PWM Set 4										0x44	0	1	0	0	0	1	0	0	
Blink & PWM Set 5										0x45	0	1	0	0	0	1	0	1	
Dot Correction										0x80	1	0	0	0	0	0	0	0	Selection of Dot Correction Register
Control Register										0xC0	1	1	0	0	0	0	0	0	Selection of Control Register

Data Definition of the single frames

One frame consists of 2 datasets, the On/Off dataset and the Blink & PWM dataset. Where more On/Off frames can be linked to one PWM set. Depending on the used PWM sets more or less On/Off frames can be stored inside the AS1130 (see Table 8).

Each On/Off Frame needs to define the used Blink & PWM dataset.

Table 8. RAM Configuration

RAM Configuration	Blink & PWM Sets	On/Off Frames	On/Off Frames with Dot Correction
1	1	36	35
2	2	30	29
3	3	24	23
4	4	18	17
5	5	12	11
6	6	6	5

It's necessary to define the RAM configuration before data can be written to the frame datasets. The RAM configuration is defined in the AS1130 config register (see Table 20 on page 25) via bit 2:0 and bit 4 for Dot Correction.

Note: After a first write of data to the frames, the configuration is locked in the AS1130 config register and can be changed only after a reset of the device. A change of the RAM configuration requires to re-write the frame datasets.

12x11 LED Matrix

The AS1130 is configured to control one big LED matrix.

Figure 24. AS1130 - Dot Matrix Structure
In Table 9 it's described which databit represents which LED in the matrix. Per default all databits are '0', meaning no LED is on. A '1' puts the LED on.

Each Current Segment of the LED Matrix consists of 11 LEDs, therefore 2 bytes of data are required for one Current Segment. CS0 is defined by the two bytes with address 0x00 and 0x01 and also includes the address of the used Blink & PWM dataset for this frame.

Table 9. LEDs On/Off Frame Register Format

Segment	Address									Data

The Blink & PWM sets contain blink on/off and the digital PWM information for each LED in the matrix. The number of PWM datasets is flexible according to the defined RAM configuration (see Figure 8 on page 14).

In the blink register (see Table 10) every single LED can be set to blink. The blink period is set in the display option register (see Display Option Register Format on page 24).

Table 10. LEDs Blink Frame Register Format

Segment	Address									Data

Dot Correction Register

The AS1130 offers a feature to define a correction factor for the analog current for every segment. This correction factor is called Dot Correction and is defined in the Dot Correction register (see Table 12). The Dot Correction Register is selected via data 128 on addr 253.

Table 12. Dot Correction Register Format

Segment	Address									Data							
	HEX	A7	A6	A5	A4	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0
0	0x00	0	0	0	0	0	0	0	0	8 bit Dot Correction							
1	0x01	0	0	0	0	0	0	0	1	8 bit Dot Correction							
2	0x02	0	0	0	0	0	0	1	0	8 bit Dot Correction							
3	0x03	0	0	0	0	0	0	1	1	8 bit Dot Correction							
4	0x04	0	0	0	0	0	1	0	0	8 bit Dot Correction							
5	0x05	0	0	0	0	0	1	0	1	8 bit Dot Correction							
6	0x06	0	0	0	0	0	1	1	0	8 bit Dot Correction							
7	0x07	0	0	0	0	0	1	1	1	8 bit Dot Correction							
8	0x08	0	0	0	0	1	0	0	0	8 bit Dot Correction							
9	0x09	0	0	0	0	1	0	0	1	8 bit Dot Correction							
A	0x0A	0	0	0	0	1	0	1	0	8 bit Dot Correction							
B	0x0B	0	0	0	0	1	0	1	1	8 bit Dot Correction							

Control-Registers

The AS1130 device contains 14 control-registers which are listed in Table 13. All registers are selected using a 8-bit address word, and communication is done via the serial interface. Select the Control Register via the Register Selection (see Table 7 on page 14).

The Control Register is selected via data 192 on addr 253.

Table 13. Control Register Address Map

Register Name	HEX	Register Address								Register Data
		A7	A6	A5	A4	A3	A2	A1	A0	D7:D0
Picture	0x00	0	0	0	0	0	0	0	0	(see Table 14 on page 21)

	....									
	0x37	0	0	1	1	0	1	1	1	

Picture Register (0x00)

In this register it must be set if a picture is to display on the LED matrix or not. Also the address of the picture which should be displayed must be set withi n this register. The default setting of this register is 0x00.

Table 14. Picture Register Format

0x00 Picture Register				
Bit	**Bit Name**	**Default**	**Access**	**Bit Description**
7	blink_pic	0	R/W	All LEDs in blink mode during display picture **0:** no blink **1:** all LEDs blink
6	display_pic	0	R/W	Display Picture **0:** no picture **1:** display picture
5:0	pic_addr	000000	R/W	Address of Picture **000000:** Frame 0 **000001:** Frame 1 **000010:** Frame 2 **000011:** Frame 3 **000100:** Frame 4 **000101:** Frame 5 .... **100000:** Frame 32 **100001:** Frame 33 **100010:** Frame 34 **100011:** Frame 35

Note: The *display_pic* bit (bit 6 in Picture Register) has lower priority than the *display_movie* bit (bit 6 in Movie Register).

Movie Register (0x01)

In this register it must be set if a movie is to display on the LED matrix or not. Also the address of the first frame in the movie needs be set within this register. The default setting of this register is 0x00.

Table 15. Movie Register Format

0x01 Movie Register				
Bit	**Bit Name**	**Default**	**Access**	**Bit Description**
7	blink_movie	0	R/W	All LEDs in blink mode during play movie **0:** no blink **1:** all LEDs blink
6	display_movie	0	R/W	**0:** no movie **1:** start movie
5:0	movie_addr	000000	R/W	Address of first Frame in Movie **000000:** Frame 0 **000001:** Frame 1 **000010:** Frame 2 **000011:** Frame 3 **000100:** Frame 4 **000101:** Frame 5 .... **100000:** Frame 32 **100001:** Frame 33 **100010:** Frame 34 **100011:** Frame 35

Note: The *display_movie* bit (bit 6 in Movie Register) has higher priority than the *display_pic* bit (bit 6 in Picture Register).

Movie Mode Register (0x02)

Within this register two movie play options can be set. Per default this register is set to 0x00.

- In scroll mode a movie can stop with the last frame of the movie or scroll endless
- The number of frames to play in a movie

Table 16. Movie Mode Register Format

0x02 Movie Mode Register				
Bit	Bit Name	Default	Access	Bit Description
7	blink_en	0	R/W	LED blink option [1] **0:** enabled **1:** disabled
6	end_last	0	R/W	defines at which frame a movie stops in scroll mode **0:** movie ends with 1st frame **1:** movie ends with last frame
5:0	movie_frames	000000	R/W	Number of frames played in a movie, starting at movie_addr defined in Movie Register **000000:** Play 1 Frame **000001:** Play 2 Frames **000010:** Play 3 Frames **000011:** Play 4 Frames **000100:** Play 5 Frames **000101:** Play 6 Frames .... **100000:** Play 33 Frames **100001:** Play 34 Frames **100010:** Play 35 Frames **100011:** Play 36 Frames

1. Disable blink option overrides any blink definition in PWM data definition or global blink definition in picture register & movie register bit 7.

Frame Time/Scroll Register (0x03)

Every single frame in a movie is displayed for a certain time before the next frame is displayed. This time can be set within this register with 4 bits. The stated values in Table 17 are typical values.

Also the scroll options are set within this register. Per default this register is set to 0x00.

Table 17. Frame Time/Scroll Register Format

Bit	Bit Name	Default	Access	Bit Description
0x03 Frame Time/Scroll Register
7	frame_fad	0	R/W	Fade Frame Option (not available in 5 LED block configuration) **0:** no fading **1:** fading of a Frame
6	scroll_dir	0	R/W	Scroll Direction **0:** scroll to right **1:** scroll to left
5	block_size	0	R/W	Define block size for scrolling **0:** scroll in full matrix **1:** scroll in 5 LED blocks (current sources split in 2 sections, See Scroll Function on page 31)
4	Enable Scrolling	0	R/W	Scroll digits at play movie **0:** no scrolling **1:** scrolling digits at play movie
3:0	frame_delay	0000	R/W	Delay between frame change in a movie **0000:** play frame only one time **0001:** 32.5ms **0010:** 65ms **0011:** 97.5ms **0100:** 130ms **0101:** 162.5ms **0110:** 195ms **0111:** 227.5ms **1000:** 260ms **1001:** 292.5ms **1010:** 325ms **1011:** 357.5ms **1100:** 390ms **1101:** 422.5ms **1110:** 455ms **1111:** 487.5ms

Display Option Register (0x04)

In this register the number of loops in a movie are defined. With the scan-limit it can be controlled how many digits are displayed in each matrix. When all 12 digits in the matrix are displayed, the display scan rate is 430Hz (typ.). If the number of digits to display is reduced, the update frequency is increased. Per default this register is set to 0x20.

Table 18. Display Option Register Format

0x04 Display Option Register				
Bit	**Bit Name**	**Default**	**Access**	**Bit Description**
7:5	loops	001	R/W	Number of loops played in one movie **000:** not valid **001:** 1 loop **010:** 2 loops **011:** 3 loops **100:** 4 loops **101:** 5 loops **110:** 6 loops **111:** play movie endless (needs to be reset to 0-6 to stop movie); for scroll endless set bit end_last = '0'
4	blink_freq	0	R/W	Blink period **0:** 1.5s **1:** 3s
3:0	scan_limit	0000	R/W	Number of displayed segments in one frame (scan-limit) **0000:** CS0 **0001:** CS0 to CS1 **0010:** CS0 to CS2 **0011:** CS0 to CS3 **0100:** CS0 to CS4 **0101:** CS0 to CS5 **0110:** CS0 to CS6 **0111:** CS0 to CS7 **1000:** CS0 to CS8 **1001:** CS0 to CS9 **1010:** CS0 to CS10 **1011:** CS0 to CS11

Note: To stop a movie in *play endless* mode, bits D7:D5 have to be set to a value between 000 to 110.

Current Source Register (0x05)

Within this registers the current for every single LED can be set from 0mA to 30mA in 255 steps (8 bits). Per default this register is set to 0x00.

Table 19. Current Source Register Format

0x05 Current Source Register				
Bit	**Bit Name**	**Default**	**Access**	**Bit Description**
7:0	current	00000000	R/W	**00000000:** 0mA **11111111:** 30mA

AS1130 Config Register (0x06)

Per default this register is set to 0x00.

Table 20. AS1130 Config Register Format

	0x06 AS1130 Config Register			
Bit	Bit Name	Default	Access	Bit Description
7	low_vdd_rst	0	R/W	**0:** at the end of a movie or a display picture the "low_VDD" flag is not changed **1:** at the end of a movie or a display picture, the "low_VDD" flag is set to "0"
6	low_vdd_stat	0	R/W	This bit indicates the supply status **0:** if low_VDD is detected, the Interrupt Status Register will be updated accordingly and pin IRQ is triggered. **1:** the low_VDD bit is directly mapped to the pin IRQ. This can be used to control an external DC/DC Converter or Charge Pump. In this case pin IRQ can't be used for interrupt functionality, the Interrupt Status REgister will be updated accordingly.
5	led_error_correction	0	R/W	This bit defines the LED open handling **0:** open LEDs which are detected at LED open test, are NOT disabled **1:** open LEDs which are detected at LED open test, are disabled
4	dot_corr	0	R/W	Analog current DotCorrection[1] **0:** disabled **1:** enabled
3	common_addr	0	R/W	I²C Common Address **0:** disabled **1:** enabled (all AS1130 are reacting on the same address "0111111")
2:0	mem_conf	000	R/W	Define Memory Configuration [1] (see Table 8 on page 14) **000:** Invalid Configuration (default value) **001:** RAM Configuration 1 **010:** RAM Configuration 2 **011:** RAM Configuration 3 **100:** RAM Configuration 4 **101:** RAM Configuration 5 **110:** RAM Configuration 6

1. This configuration is locked after the first write access to ON/OFF, PWM od DotCorrection data section. Unlock can be performed only by a reset of the device.

Interrupt Mask Register (0x07)

Per default this register is set to 0x20.

Table 21. Interrupt Mask Register Format

	0x07 Interrupt Mask Register			
Bit	Bit Name	Default	Access	Bit Description
7	selected_pic	0	R/W	IRQ pin triggers if defined Frame is displayed (see Interrupt Frame Definition Register (0x08) on page 26) **0:** disabled **1:** enabled
6	watchdog	0	R/W	IRQ pin triggers if the I²C watchdog triggers **0:** disabled **1:** enabled
5	por	1	R/W	IRQ pin triggers if POR is active **0:** disabled **1:** enabled

Table 21. Interrupt Mask Register Format

0x07 Interrupt Mask Register				
Bit	Bit Name	Default	Access	Bit Description
4	overtemp	0	R/W	IRQ pin triggers if the over temperature limit is reached **0:** disabled **1:** enabled
3	low_vdd	0	R/W	IRQ pin triggers if VDD is to low for used LEDs (low_VDD flag) **0:** disabled **1:** enabled
2	open_err	0	R/W	IRQ pin triggers if an error on the open test occurs **0:** disabled **1:** enabled
1	short_err	0	R/W	IRQ pin triggers if an error on the short test occurs **0:** disabled **1:** enabled
0	movie_fin	0	R/W	IRQ pin triggers if a movie is finished **0:** disabled **1:** enabled

Interrupt Frame Definition Register (0x08)

Per default this register is set to 0x3F.

Table 22. Interrupt Frame Definition Register Format

0x08 Interrupt Frame Definition Register				
Bit	Bit Name	Default	Access	Bit Description
7:6	-	00	n/a	
5:0	last_frame	111111	R/W	After this frame is displayed the last time (depending on the number of loops played in a movie) an interrupt will be triggered. **000000:** Frame 0 **000001:** Frame 1 **000010:** Frame 2 **000011:** Frame 3 **000100:** Frame 4 **000101:** Frame 5 .... **100000:** Frame 32 **100001:** Frame 33 **100010:** Frame 34 **100011:** Frame 35

Shutdown & Open/Short Register (0x09)

Per default this register is set to 0x02.

Table 23. Shutdown & Open/Short Register Format

0x09 Shutdown & Open/Short Register				
Bit	Bit Name	Default	Access	Bit Description
7:5	-	000	n/a	
4	test_all	0	R/W	The LED open/short test is performed on all LED locations **0:** disabled **1:** enabled

Table 23. Shutdown & Open/Short Register Format

0x09 Shutdown & Open/Short Register				
Bit	Bit Name	Default	Access	Bit Description
3	auto_test	0	R/W	The LED open/short test is automatically started at display picture/frame **0:** disabled **1:** enabled
2	manual_test	0	R/W	The LED open/short test is started manually **0:** disabled **1:** enabled
1	init	1	R/W	**0:** initialise control logic (internal State machine is reset again) **1:** normal operation
0	shdn	0	R/W	**0:** device is in shutdown mode (Outputs are turned off, internal State machine stops) **1:** normal operation

I²C Interface Monitoring Register (0x0A)

This register is used to monitor the activity on the I²C bus. If a deadlock situation occurs (e.g. the bus SDA pin is pulled to low and no communication is possible) the chip will reset the I²C interface and the master is able to start the communication again.

The time window for the reset of the interface of the AS1130 can bes set via 7 bits from 256µs to 33ms. The default setting of this register is 0xFF.

Table 24. I²C Interface Monitoring Register Format

0x0A I²C Interface Monitoring Register				
Bit	Bit Name	Default	Access	Bit Description
7	-	1	n/a	
6:1	Time out window	11111	R/W	Definition of the Time out window (0 to 127 => 1 to 128x256µs) **0000000:** 256µs **1111111:** 32.7ms
0	i2c_monitor	1	R/W	**0:** I²C monitoring off **1:** I²C monitoring on

CLK Synchronization Register (0x0B)

The default setting of this register is 0x00.

Table 25. CLK Synchronization Register Format

0x0B CLK Synchronization Register				
Bit	Bit Name	Default	Access	Bit Description
7:4	-	0000	n/a	
3:2	clk_out	00	R/W	Adjustable clock out frequency **00:** 1MHz **01:** 500kHz **10:** 125kHz **11:** 32kHz

Table 25. CLK Synchronization Register Format

0x0B CLK Synchronization Register				
Bit	Bit Name	Default	Access	Bit Description
1	sync_out	0	R/W	The internal oscillator is used as system-clk. The selected clk frequency is available on pin D4 for synchronization. (Output)[1] **0:** disabled **1:** enabled
0	sync_in	0	R/W	The internal oscillator is disabled. Pin D4 is used as clk input for system-clk.[1] **0:** disabled **1:** enabled

1. CLK synchronization is done via the SYNC pin. Only one option can be activated (Input or Output).

Interrupt Status Register (0x0E)

This is a read only register. Within this register the cause of an interrupt can be read out. After power up or a reset the default setting of this register is 0x20. A read out command will set this register to default and the IRQ pin will be released again.

Table 26. Interrupt Status Register Format

0x0E Interrupt Status Register				
Bit	Bit Name	Default	Access	Bit Description
7	frame_int	0	R	**0:** no interrupt **1:** defined Frame is displayed (see Interrupt Frame Definition Register (0x08) on page 26)
6	i2c_int	0	R	**0:** no interrupt **1:** I²C watchdog reports a deadlock on the interface
5	por_int	1	R	**0:** no interrupt **1:** POR was triggered
4	overtemp_int	0	R	**0:** no interrupt **1:** over temperature limit is reached
3	low_vdd_int	0	R	**0:** no interrupt **1:** V_{DD} is too low to drive requested current through the LEDs
2	open_int	0	R	**0:** no interrupt **1:** error on open test
1	short_int	0	R	**0:** no interrupt **1:** error on short test
0	movie_int	0	R	0: no interrupt 1: play movie is finished

AS1130 Status Register (0x0F)

This is a read only register. From this register the actual status of the AS1130 can be read out. The default setting of this register is 0x00.

Table 27. AS1130 Status Register Format

0x0F AS1130 Status Register				
Bit	Bit Name	Default	Access	Bit Description
7:2	frame_on	000000	R	Actual displayed frame **000000:** Frame 0 **000001:** Frame 1 **000010:** Frame 2 **000011:** Frame 3 **000100:** Frame 4 **000101:** Frame 5 .... **100000:** Frame 32 **100001:** Frame 33 **100010:** Frame 34 **100011:** Frame 35
1	movie_on	0	R	**0:** no movie **1:** movie playing
0	test_on	0	R	**0:** no test is running **1:** open/short test ongoing

AS1130 Open LED Register (0x20 to 0x37)

This is a read only register. From this register the LED's which failed with an open error can be read out. A '1' indicates LED okay, a '0' stands for LED open. If a LED, which is physically not connected to the device is tested, the Open LED test will return a '0'.

10 Typical Application

Scroll Function

The AS1130 offers a feature for scrolling a picture through the matrix without the need of communication via a µP. The scrolling can be done in the whole matrix (11x12) or optimized for a ticker in a 5x24 Matrix (see Figure 25).

Figure 25. LED configuration for 5LED block scroll function
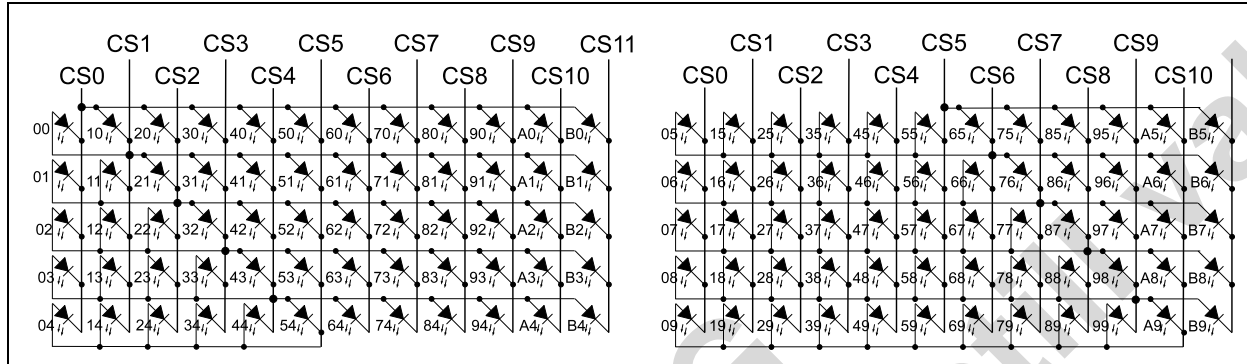

In the movie display mode the frame is shown in the matrix at once. On the contrary in the scroll function the frame is shifted through the matrix segment after segment (CS0 to CS1 to CS2 to CS3 ......).
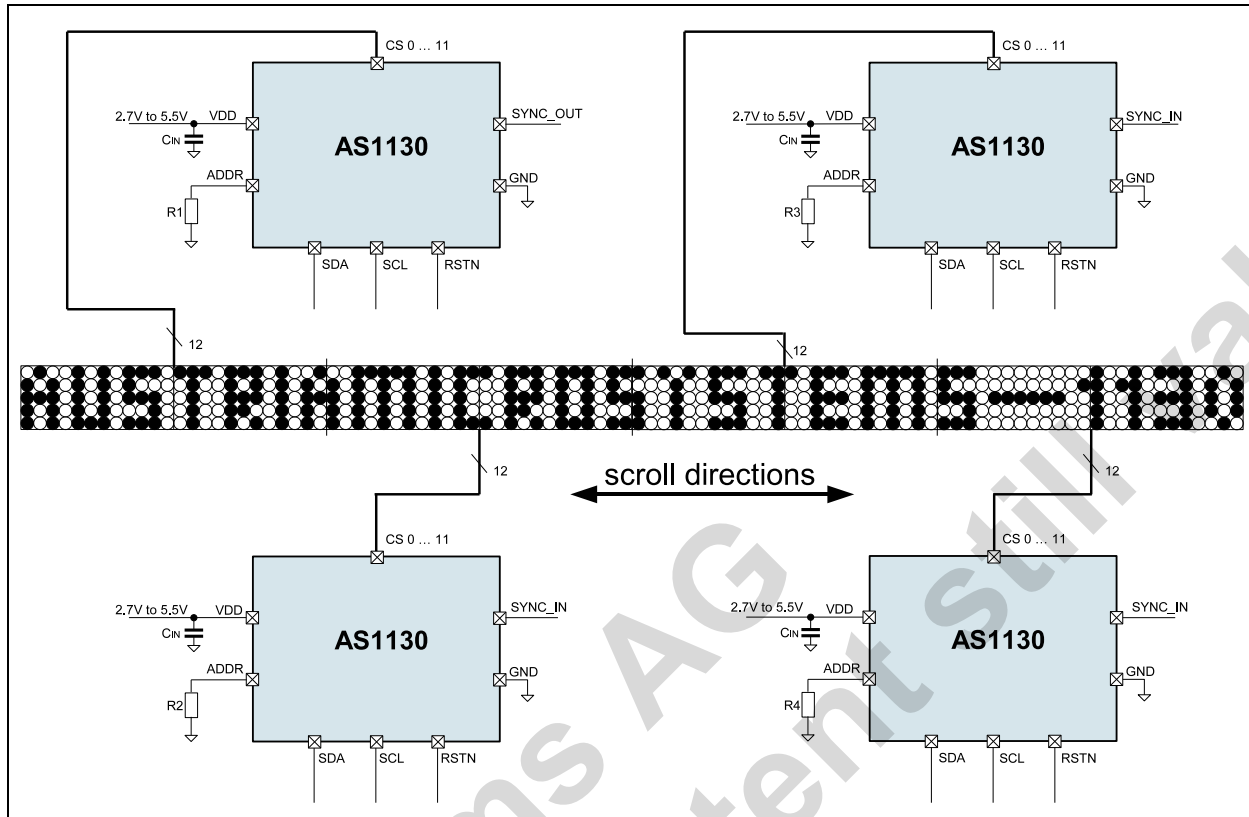

Figure 26. Scrolling

Figure 27. Ticker Application with 5x96 LED Matrix

LED Current Calculation

The current through a LED in the matrix is set via three registers (Current Source Register, Dot Correction and PWM). The resulting current through the single LED can be calculated as shown in the following.

First it's necessary to calculate the time how long one LED will be ON.

$$t_{LEDon} = \frac{PWM}{f_{OSC}} \qquad (EQ\ 1)$$

Where:

t_{LEDon} . . . . time where the LED is ON

PWM . . . value set in the register (0 - 256), (see Table 11 on page 18)

f_{OSC} . . . frequency set in the CLK Synchronization Register, (see Table 25 on page 27)

The refresh rate is defined by the scan-limit and f_{OSC}.

$$t_{REFRESH} = \frac{(scanlimit + 1) \times 256}{f_{OSC}} \qquad (EQ\ 2)$$

Where:

$t_{REFRESH}$ . . . time needed to refresh the matrix

scan-limit . . . is set via the Display Option Register (0 - 11), (see Table 18 on page 24)

f_{OSC} . . . frequency set in the CLK Synchronization Register, (see Table 25 on page 27)

With the LED on-time and the refresh rate an average LED ON factor can be calculated.

$$LEDon_{avg} = \frac{t_{LEDon}}{t_{REFRESH}} = \frac{PWM}{(scanlimit + 1) \times 256} \qquad (EQ\ 3)$$

The resulting current is then the Segment Current (set in the Current Source Register) times the average LED ON factor.

$$I_{LEDavg} = I_{SEG} \times LEDon_{avg} = I_{SEG} \times \frac{PWM}{(scanlimit + 1) \times 256} \qquad (EQ\ 4)$$

Where:

I_{SEG} . . . Segment Current set via register (see Table 19 on page 24)

Example:

Assume that following conditions are set in the registers: PWM = 256, scan-limit = 5 (half filled matrix, 66 LEDs), I_{SEG} = 30mA

$$I_{LEDavg} = 30mA \times \frac{256}{(5 + 1) \times 256} = 5mA \qquad (EQ\ 5)$$
