General Description

AS3xxx316 is a magneto-resistive random-access memory (MRAM). It is offered in density ranging from 1Mbit to 32Mbit. MRAM technology is analogous to Flash technology with SRAM compatible 35ns/35ns read/write timings (Persistent SRAM, P-SRAM). Data is always non-volatile. This makes MRAM a very reliable and fast non-volatile memory solution.

Table 1: Technology Comparison

	SRAM	Flash	EEPROM	MRAM
Non-Volatility	–	√	√	√
Write Performance	√	–	–	√
Read Performance	√	–	–	√
Endurance	√	–	–	√
Power	–	–	–	√

MRAM is a true random-access memory; allowing both reads and writes to occur randomly in memory. MRAM is ideal for applications that must store and retrieve data without incurring large latency penalties. It offers low latency, low power, virtually unlimited endurance and data retention, high performance and scalable memory technology.

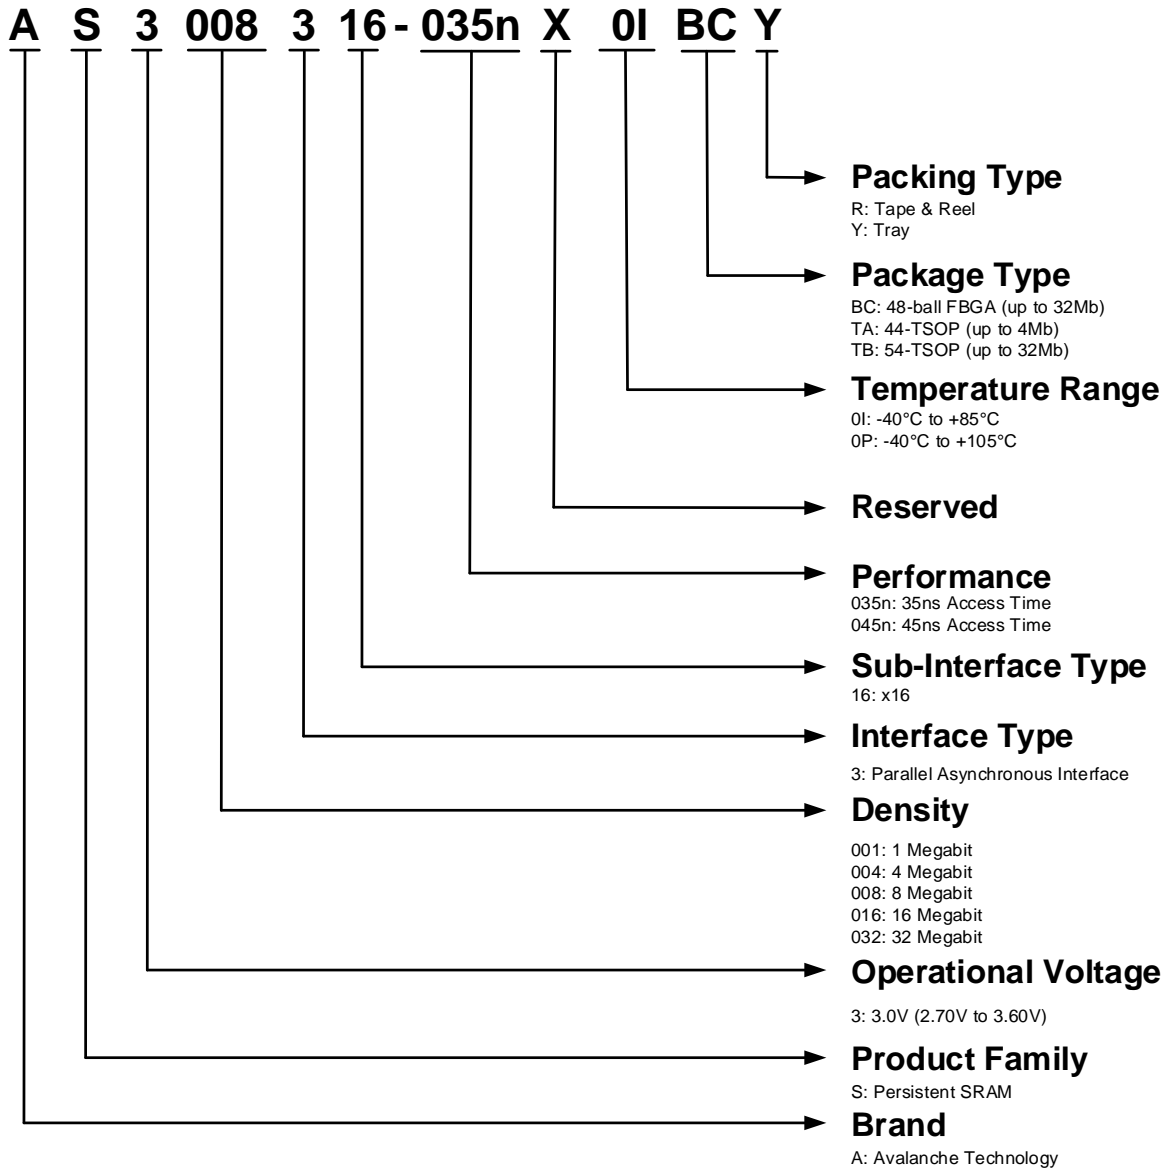

AS3xxx316 is available in small footprint 54-pin TSOP (10mm x 22mm) and 48-Ball FBGA (10mm x 10mm) packages supporting densities ranging from 1Mb to 32Mb. Densities of 1Mb and 4Mb are also available in a small footprint 44-pin TSOP (10mm x 18mm). These packages are compatible with similar low-power volatile and non-volatile products.

AS3xxx316 is offered with industrial (-40°C to 85°C) and industrial plus (-40°C to 105°C) operating temperature ranges.

Signal	Type	Description
SE#	Input	Sleep: Enables or disables Low power mode.
E#	Input	Chip enable: Enables or disables the MRAM.
G#	Input	Output enable: Enables the output drivers in bidirectional data transfer I/Os.
W#	Input	Write enable: Transfers serial data from the host system to the MRAM when Low (Logic '0'). Transfers serial data from the MRAM to the host system when High (Logic '1').
UB#	Input	Upper Byte Enable: Enables or disables DQ[15:8].
LB#	Input	Lower Byte Enable: Enables or disables DQ[7:0].
ADDR[20:0]	Input	Address: I/Os for address transfer. 01M: ADDR[15:0] – 16 Address pins for 01M devices. 04M: ADDR[17:0] – 18 Address pins for 04M devices. 08M: ADDR[18:0] – 19 Address pins for 08M devices. 16M: ADDR[19:0] – 20 Address pins for 16M devices. 32M: ADDR[20:0] – 21 Address pins for 32M devices.
DQ[15:0]	Input / Output	Data inputs/outputs: The bidirectional I/Os transfer data.
V_{cc}	Supply	V_{cc}: Core and I/O power supply.
V_{ss}	Supply	V_{ss}: Core and I/O ground supply.
NC		No connect: NCs are not internally connected. They can be driven or left unconnected.
DNU		Do not use: DNUs must be left unconnected.

- Dimensions in Millimeters.
- The 'e' represents the basic solder ball grid pitch.
- 'b' is measurable at the maximum solder ball diameter in a plane parallel to datum C.
- Dimension 'ddd' is measured parallel to primary datum C.
- Primary datum C (seating plane) is defined by the crowns of the solder balls.
- Package dimensions refer to JEDEC MO-205 Rev. G.

Architecture

AS3xxx316 is a high performance MRAM device. Writing to and reading from the device as follows:

To write to the device, bring Chip Enable (E#) and Write Enable (W#) inputs Low (Logic '0'). This enables data on I/O pins (DQ[0] to DQ[15]) to be written into the memory location specified by the address pins ADDR[0] through ADDR[20] (54-pin TSOP and 48-ball FBGA) and ADDR[0] through ADDR[17] (44-pin TSOP).

To read from the device, bring Chip Enable (E#) input Low (Logic '0'), Output Enable (G#) input Low (Logic '0') while maintaining Write Enable (W#) High (Logic '1'). This enables data from the memory location specified by the address pins ADDR[0] through ADDR[20] (54-pin TSOP and 48-ball FBGA) and ADDR[0] through ADDR[17] (44-pin TSOP) to appear on I/O pins (DQ[0] to DQ[15]).

Device Initialization

When powering up, the following procedure is required to initialize the device correctly:

- E#, W#, G#, SE# must follow V_{CC} during power-up

Figure 4: Power-Up Behavior

When powering down, the following procedure is required to turn off the device correctly:

- E#, W#, G#, SE# must follow V_{CC} during power-down
- During power loss or brownout, where V_{CC} goes below V_{wi} , read/write operations are prohibited. The power-up timing needs to be observed after V_{CC} goes above V_{CC} (minimum)

Figure 5: Power-Down Behavior

Sleep Mode - The device incorporate a sleep mode of operation to achieve lowest power supply current condition

- The device enters the sleep mode by asserting the SE# pin low. Read and Write operation must be completed before the SE# pin going low.
- When SE# is asserted low, it should remain low for at least 5 μ S.
- Sleep exit is achieved by asserting the SE# pin high. There is a 5 μ S wait delay before the device is operational.
- If sleep mode is not used, the SE# pin should be tied to V_{CC} .
 - For existing designs migrating to this device, it is not required to tie this pin to V_{CC} . The pin can be left as NC. The pin has a pull-up on-chip and the device will function normally with this pin not connected.
