WRITE CYCLE 1 (WE# Controlled) (1,2,3,5,6)**WRITE CYCLE 2 (CE# and CE2 Controlled) (1,2,5,6)****Notes :**

1. WE#, CE# must be high or CE2 must be low during all address transitions.
2. A write occurs during the overlap of a low CE#, high CE2, low WE#.
3. During a WE#-controlled write cycle with OE# low, tWP must be greater than tWHZ + tDW to allow the drivers to turn off and data to be placed on the bus.
4. During this period, I/O pins are in the output state, and input signals must not be applied.
5. If the CE#-low transition and CE2 high transition occurs simultaneously with or after WE# low transition, the outputs remain in a high impedance state.
6. tOW and tWHZ are specified with $C_L = 5pF$. Transition is measured $\pm 500mV$ from steady state.
