User's Guide

<High Voltage Safety Precautions>

◇ Read all safety precautions before use

Please note that this document covers only the BM2P016T evaluation board (BM2P016T-EVK-004) and its functions. For additional information, please refer to the datasheet.

To ensure safe operation, please carefully read all precautions before handling the evaluation board

Depending on the configuration of the board and voltages used,

Potentially lethal voltages may be generated.

Therefore, please make sure to read and observe all safety precautions described in the red box below.

Before Use

- [1] Verify that the parts/components are not damaged or missing (i.e. due to the drops).
- [2] Check that there are no conductive foreign objects on the board.
- [3] Be careful when performing soldering on the module and/or evaluation board to ensure that solder splash does not occur.
- [4] Check that there is no condensation or water droplets on the circuit board.

During Use

- [5] Be careful to not allow conductive objects to come into contact with the board.
- [6] **Brief accidental contact or even bringing your hand close to the board may result in discharge and lead to severe injury or death.**

Therefore, DO NOT touch the board with your bare hands or bring them too close to the board.

In addition, as mentioned above please exercise extreme caution when using conductive tools such as tweezers and screwdrivers.

- [7] If used under conditions beyond its rated voltage, it may cause defects such as short-circuit or, depending on the circumstances, explosion or other permanent damages.
- [8] Be sure to wear insulated gloves when handling is required during operation.

After Use

- [9] The ROHM Evaluation Board contains the circuits which store the high voltage. Since it stores the charges even after the connected power circuits are cut, please discharge the electricity after using it, and please deal with it after confirming such electric discharge.
- [10] Protect against electric shocks by wearing insulated gloves when handling.

This evaluation board is intended for use only in research and development facilities and should be handled **only by qualified personnel familiar with all safety and operating procedures.**

We recommend carrying out operation in a safe environment that includes the use of high voltage signage at all entrances, safety interlocks, and protective glasses.

AC/DC Converter

Isolation Fly-back Converter PWM method Output 48 W 24 V BM2P016T Reference Board

BM2P016T-EVK-004

The BM2P016T-EVK-004 evaluation board outputs a 24 V voltage from an input of 90 Vac to 264 Vac. The output current provides up to 2.0 A. The BM2P016T PWM type DC / DC converter IC with 650 V MOSFET is used. The BM2P016T contributes to low power consumption by incorporating a 650 V withstand voltage startup circuit. Using current mode control, cycle-by-cycle current limiting provides excellent performance in bandwidth and transient response. The switching frequency is fixed at 65 kHz. At light loads, frequency reduction achieves high efficiency. Built-in frequency hopping function contributes to low EMI. The low on-resistance 1.4 Ω · 650 V withstand voltage MOSFET is built in, contributing to low power consumption and easy design.

The optimized EMI design complies with CISPR 22 Class B for noise terminal voltage / radiation emission testing.

Figure 1. BM2P016T-EVK-004

Electronics Characteristics

Not guarantee the characteristics, is representative value. Unless otherwise noted: $V_{IN} = 230 \text{ Vac}$, $I_{OUT} = 1.5 \text{ A}$, $T_a = 25 \text{ }^\circ\text{C}$

Parameter	Min	Typ	Max	Units	Conditions
Input Voltage Range	90	230	264	V	
Input Frequency	47	50/60	63	Hz	
Output Voltage	22.8	24.0	25.2	V	
Maximum Output Power	-	-	48	W	$I_{OUT} = 2 \text{ A}$
Output Current Range ^(NOTE1)	0.0	1.5	2.0	A	
Stand-by Power	-	280	-	mW	$I_{OUT} = 0 \text{ A}$
Efficiency	83.0	86.4	-	%	$I_{OUT} = 2 \text{ A}$
Output Ripple Voltage ^(NOTE2)	-	180	-	mVpp	
Operating Temperature Range	-10	+25	+65	$^\circ\text{C}$	

(NOTE1) Please adjust operating time, within any parts surface temperature under 105 $^\circ\text{C}$

(NOTE2) Not include spike noise

Operation Procedure

1. Operation Equipment

- (1) AC Power supply 90 ~ 264 Vac, over 50W
- (2) Electronic Load capacity 2.0 A
- (3) Multi meter

2. Connect method

- (1) AC power supply presetting range 90~264 Vac, Output switch is off.
- (2) Load setting under 2 A. Load switch is off.
- (3) AC power supply N terminal connect to the board AC (N) of CN1-2, and L terminal connect to AC (L) of CN1-3.
- (4) Load + terminal connect to VOUT of CN2-2, GND terminal connect to GND of CN2-1
- (5) AC power meter connect between AC power supply and board.
- (6) Output test equipment connects to output terminal
- (7) AC power supply switch ON.
- (8) Check that output voltage is 24 V
- (9) Electronic load switch ON
- (10) Check output voltage drop by load connect wire resistance

Figure 2. Connection Circuit

Deleting

Maximum Output Power P_o of this reference board is 48 W. The derating curve is shown on the below. If ambient temperature is over 40°C, Please adjust load continuous time by over 105 °C of any parts surface temperature.

Figure 3. Temperature Derating curve

Application Circuit

BM2P016T-EVK-004 is a fly-back type circuit method, and BM2P016T is used for IC.

The BM2P016T is built-in a high withstand voltage V_{DSS} : 650 V and a low on resistance $R_{DS(ON)}$: 1.4 Ω Super-Junction MOSFET, contributing to energy saving. The voltage of the output (VOUT) is monitored by a feedback circuit and fed back to the FB terminal of IC1 through a photo coupler. The FADJ pin of IC1 can be used to fix the burst frequency at the burst mode under light load, to prevent the noise at the burst mode.

At startup, the VCC voltage is raised by supplying V_{IN} to CVCC through the startup circuit (Starter). When the VCC voltage exceeds the UVLO release voltage 13.5V typ., The IC operation starts. When the IC operates, the start-up circuit is turned off and the supply from the DRAIN pin is cut off, contributing to the reduction of standby power.

Figure 4. BM2P016T-EVK-004 Application Circuit

BM2SCQ123T Overview

Feature

- PWM frequency : 65 kHz
- PWM current mode method
- Frequency hopping function
- Burst operation at light load
- Frequency reduction function
- Built-in 650V start circuit
- Built-in 650V switching MOSFET
- VCC pin under voltage protection
- VCC pin over voltage protection
- SOURCE pin Open protection
- SOURCE pin Short protection
- SOURCE pin Leading-Edge-Blanking function
- Per-cycle over current protection circuit
- AC Correction function of over current limiter
- Soft Start Function
- Secondary over current protection circuit

Key specifications

- Operation Voltage Range: VCC: 8.9 V ~ 26.0 V
DRAIN: 650 V(Max)
- Normal Operating Current: 0.95 mA(Typ)
- Burst Operating Current: 0.30 mA(Typ)
- Oscillation Frequency: 65 kHz(Typ)
- Operating Temperature: -40 °C ~ +105 °C
- MOSFET Ron: 1.4 Ω(Typ)

Application

AC adapters and household appliance (vacuum cleaners, humidifiers, air cleaners, air conditioners, IH cooking heaters, rice cookers, etc.)

Dimension

W(Typ) x D(Typ) x H(Max)

TO220-7M

10.0 mm x 4.6 mm x 25.4 mm

Figure 5. TO220-7M Package

(*) Product structure: Monolithic integrated circuit mainly made of silicon. No radiation resistant design

(*) Exceeding the absolute maximum ratings, such as applied voltage and operating temperature range, may lead to deterioration or destruction. Also, the short mode or open mode cannot assume the destruction state. If a special mode that exceeds the absolute maximum rating is assumed, Please consider physical safety measures such as fuses.

Design Overview

1 Important parameter

- V_{IN} : Input Voltage Range AC 90 V ~ 264 Vac (DC 100 V ~ 380 V)
- V_{OUT} : Output Voltage DC 24 V
- $I_{OUT}(typ)$: Constant Output Current 1.5 A
- $I_{OUT}(max)$: Maximum Output Current 2.0 A
- f_{sw} : Max Switching Frequency min:61 kHz, typ:65 kHz, max:69 kHz
- V_{SOURCE} : Over Current Detection Voltage min:0.375 V, typ:0.400 V, max:0.425 V

2 Transformer Design

2.1 Setting fly-back voltage VOR

Determine the fly-back voltage VOR and find the turns ratio $N_p : N_s$, Duty ratio. With $V_{IN}(min) = 100 V$ and $V_F = 1.5 V$, target VOR to about 100 V. In this case, the turns ratio $N_p : N_s = 4.38$ determined later.

$$VOR = (V_{OUT} + V_F) \times \frac{N_p}{N_s} = \frac{t_{on}}{t_{off}} \times V_{IN} = 111.7$$

$$\frac{N_p}{N_s} = \frac{VOR}{V_{OUT} + V_F} = \frac{111.7 V}{24 V + 1.5 V} = 4.38$$

$$Duty(max) = \frac{VOR}{V_{IN}(min) + VOR} = \frac{111.7 V}{100 V + 111.7 V} = 0.527$$

Figure 6. MOSFET Drain Waveform

Set VOR so that Duty is 0.5 or less in consideration of MOSFET loss and so on.

2.2 Selection of operation mode

The PWM driven Fly-back switching regulator transfers power from the primary side to the secondary side using a transformer.

There are three types of transformer operation modes:

- CCM (Continuous Current Mode) : The primary side switching element is turned on before the charging current of the secondary side coil is completely discharged. Since the coil current is continuous.
- BCM (Boundary Current Mode) : The switching element on the primary side is turned on at the same time the discharge of the coil on the secondary side is completed.
- DCM (Dis-continuous Current Mode) : The primary side switching element turns on after the secondary side coil is completely discharged. It is called current discontinuous mode because the coil current is not continuous.

BM2P016 works properly in either CCM or DCM mode. In this design, the transformer is designed to be BCM at a load current of 1.5 A with an input voltage of DC 260 V (AC conversion: 185 Vac).

Figure 7. Switching Waveform (MOSFET V_{DS} , I_P , I_S)

2 Transformer design -Continued

2.3 Calculation of inductance value

Selecting the optimum inductor value will improve power supply efficiency. The figure below shows the peak current I_{PPK} of the transformer and the input voltage / output current characteristics of the DC current I_{DC} at switching ON. Increasing the transformer inductance value reduces the transformer peak current. Low peak current offers benefits such as reduced power dissipation and smaller components. However, when the input voltage is low or the output current is large, the continuous mode CCM is set, and a DC current I_{DC} is generated. When DC current is generated, switching loss increases, and disadvantages such as deterioration of power supply efficiency and generation of switching noise increase.

Figure 8. Current of Transfer

Figure 9. Relation of V_{IN} vs. Current

Figure 10. Relation of V_{OUT} v. Current

Under the condition that the input voltage $V_{IN} = 260$ Vdc input, the load current $I_{OUT(BCM)} = 1.5$ A, and the BCM when the oscillation frequency is 65 kHz, find the primary winding inductance L_P and secondary winding inductance L_S .

$$Duty = \frac{V_{OR}}{V_{IN} + V_{OR}} = \frac{111.7 V}{260 V + 111.7 V} = 0.301$$

The secondary side inductance L_S in the case of becoming BCM is calculated.

$$I_{SPK} = \frac{V_{OUT} + V_F}{L_S} \times t_{OFF} = \frac{V_{OUT} + V_F}{L_S} \times \frac{1 - Duty}{f_{SW}}$$

$$I_{OUT(BCM)} = \frac{1}{2} \times I_{SPK} \times (1 - Duty) = \frac{(V_{OUT} + V_F) \times (1 - Duty)^2}{2 \times L_S \times f_{SW}}$$

$$L_S = \frac{(V_{OUT} + V_F) \times (1 - Duty)^2}{2 \times I_{OUT(BCM)} \times f_{SW}} = \frac{(24 V + 1.5 V) \times (1 - 0.301)^2}{2 \times 1.5 A \times 65 kHz} = 63.89 \mu H$$

$$L_P = L_S \times \left(\frac{N_P}{N_S}\right)^2 = 63.89 \mu H \times (4.38)^2 = 1225.7 \mu H$$

This EVK, $L_P = 1200 \mu H$, $L_S = 62.69 \mu H$. Calculate the maximum current I_{PPK} on the primary side and the maximum current I_{SPK} on the secondary side.

2.3 Calculation of inductance value -Continued

$$I_{SPK} = \frac{V_{OUT} + V_F}{L_S} \times \frac{1 - Duty}{f_{SW}} = \frac{24 V + 1.5 V}{62.69 \mu H} \times \frac{1 - 0.301}{65 kHz} = 4.29 [A]$$

$$I_{PPK} = I_{SPK} \times \frac{N_S}{N_P} = 1.70 [A]$$

2.4 Determination of transformer size

From Po (max) = 48 W, the core size of the transformer selects EER28.

Table 2. Output power and transfer core

Output Power Po(W)	Core size	Core Cross sectional area Ae (mm ²)
~30	EI25/EE25	41
~50	EFD30	68
~60	EI28/EE28/EER28	86
~80	EI33/EER35	107

(*) The above values are guidelines. Please check with the transformer manufacturer etc. for details.

2.5 Calculation of primary winding N_P

The maximum value of the magnetic flux density B (T) of a general ferrite core is 0.4 T @ 100 °C, so Bs at = 0.35 T.

This EVK, the core cross section Ae = 86.3 mm² is selected.

$$N_P > \frac{L_P \times I_{PPK}}{A_e \times B_{sat}} = \frac{1200 \mu H \times 1.70 A}{86.3 mm^2 \times 0.35 T} = 67.5 [T]$$

The primary winding number N_P should be 68 turns or more. In this EVK, N_P = 105 turns so that it becomes tightly wound from the bobbin size of the transformer.

2.6 Calculation of secondary winding N_S

The secondary winding number N_S is expressed by the following formula.

$$\frac{N_P}{N_S} = 4.38 \rightarrow N_S = \frac{105 [T]}{4.38} = 24.0 \rightarrow 24 [T]$$

This EVK, we have N_S = 24 turns. Also, in order to reduce the leakage inductance, 24 turns are selected from the size of the transformer bobbin so as to be compact winding.

2.7 Calculation of VCC winding N_D

Assuming VCC = 17 V and V_{F_VCC} = 1 V, N_D is expressed by the following formula.

$$N_D = N_S \times \frac{V_{CC} + V_{F_VCC}}{V_{OUT} + V_F} = 24 T \times \frac{15 V + 1.0 V}{24 V + 1.5 V} = 15.1 [T]$$

2.7 Calculation of VCC winding N_D –Continued

It is assumed that $N_D = 15$ turns. When driving a MOSFET, set the VCC to 15 V or more because it is necessary to control the Gate voltage. Thun, the transformer specification is as follows.

Table 3. Transformer specification (Reference)

Core	EER28 compatible
L_P	1200 μ H
N_P	105 turns
N_S	24 turns
N_D	15 turns

Design Overview – Continued

3 Main parts selection

3.1 Input Capacitor : C6

The input capacitor value is selected based on Table 5 as a guide. Select according to specifications such as holding time.

Table 5. Input capacitor selection

入力電圧 (Vac)	Cin (μF)
85 ~ 264	2 x P _{IN} (W)
180 ~ 264	1 x P _{IN} (W)

A capacity equivalent to $48 \text{ W} / 0.84 \times 2 = 114 \text{ μF}$ is required as $P_{OUT} = 48 \text{ W}$, and the power supply efficiency is 84%. This time, it is 100 μF considering the withstand voltage and ripple current of the capacitor. The withstand voltage of the capacitor needs more than the maximum input voltage. 450 V withstand voltage is selected for up to 380 V.

3.2 Resistor of current detection : Rs (R4, R5)

Set the overload protection point of the output by limiting the current flowing to the primary side. The peak current I_{PPK} of the primary side at the time of over current detection is calculated.

$$I_{PPK} = I_{SPK} \times \frac{N_S}{N_P}$$

Calculate the peak current I_{SSK} on the secondary side at the time of over current detection. The output current in continuous mode is expressed by the following equation, and the load current at overcurrent detection is I_{OUT} (LIM).

$$I_{OUT}(LIM) = \left(I_{SPK} - \frac{1}{2} \times \frac{V_{OUT} + V_F}{L_S} \times t_{OFF} \right) \times \frac{t_{OFF}}{T}$$

Calculate on duty and off time t_{OFF}.

$$\text{Duty} = \frac{V_{OR}}{V_{IN}(min) + V_{OR}} = \frac{111.7 \text{ V}}{100 \text{ V} + 111.7 \text{ V}} = 0.528$$

$$t_{OFF} = \frac{1 - \text{Duty}}{F_{SW}} = \frac{1 - 0.528}{65 \text{ kHz}} = 7.26 \text{ [μs]}$$

Figure 13. Current detection voltage

The secondary peak current I_{SSK} is expressed by the following equation. The load current at the time of over-current detection is I_{OUT} (LIM): 2.4 A with a 20% margin from the maximum load current I_{OUT} (MAX): 2 A.

$$I_{SPK} = \frac{I_{OUT}(LIM)}{t_{OFF} \times F_{SW}} + \frac{1}{2} \times \frac{V_{OUT} + V_F}{L_S} \times t_{OFF} = \frac{2.4 \text{ A}}{7.26 \text{ μs} \times 65 \text{ kHz}} + \frac{1}{2} \times \frac{24 \text{ V} + 1.5 \text{ V}}{62.69 \text{ μH}} \times 7.26 \text{ μs} = 6.56 \text{ [A]}$$

3.2 Resistor of current detection – Continued

The primary peak current I_{PPK} is expressed by the following formula.

$$I_{PPK} = I_{SPK} \times \frac{N_S}{N_P} = 6.56 \text{ A} \times \frac{24}{105} = 1.50 \text{ [A]}$$

The primary current is voltage-converted by the sense resistor R_S , and switching is turned off by exceeding the overcurrent detection voltage. It becomes peak current I_{PPK} after delay time t_{DELAY} from over current detection. The peak current I'_{PPK} at the time of detection is calculated. t_{DELAY} is 0.1 μs .

$$I'_{PPK} = I_{PPK} - \frac{V_{IN}(min)}{L_P} \times t_{DELAY} = 1.50 \text{ A} - \frac{100 \text{ V}}{1200 \mu\text{H}} \times 0.1 \mu\text{s} = 1.49 \text{ A}$$

Calculate the on time t_{ON} and the over current detection time t_{ON}' .

$$t_{ON} = \frac{1}{F_{SW}} - t_{OFF} = \frac{1}{65 \text{ kHz}} - 7.26 \mu\text{s} = 8.12 \mu\text{s}$$

$$t'_{ON} = t_{ON} - t_{DELAY} = 8.12 \mu\text{s} - 0.10 \mu\text{s} = 8.02 \mu\text{s}$$

The over-current protection has an AC voltage correction function to compensate for the over-current protection point shift due to the difference in input voltage. Overcurrent detection voltage at 0 μs V_{SOURCE} : 400 mV, AC voltage correction ΔV_S : 20 mV / μs . The current I'_{PPK} at the time of over current detection is as follows.

$$I'_{PPK} > \frac{V_{SOURCE} + \Delta V_S \times t_{ON}'}{R_S}$$

The sense resistance R_S is calculated by the following formula.

$$R_S < \frac{V_{SOURCE} + \Delta V_S \times t_{ON}'}{I_{PPK}'} = \frac{400 \text{ mV} + 20 \text{ mV}/\mu\text{s} \times 8.02 \mu\text{s}}{1.49 \text{ A}} = 0.376 \text{ [\Omega]}$$

The sense resistance R_S should be 0.376 Ω or less.

This EVK, the sense resistances (R_4 , R_5) are 0.56 Ω in parallel and R_S is 0.28 Ω .

Also, loss P_{R4} of the current detection resistor is expressed by the following formula.

$$P_{R14}(rms) = I_{PRMS}^2 \times R_4 = \left[I_{PPK} \times \sqrt{\frac{Duty(max)}{3}} \right]^2 \times R_4 = \left[0.75 \times \sqrt{\frac{0.528}{3}} \right]^2 \times 0.56 = 0.055 \text{ [W]}$$

The MCR18 Series with a rated power of 0.25 W was selected.

3. Main parts selection - Continued

3.6 Diode for VCC : D2

For the VCC diode, a high speed diode is recommended. When $V_F = 1\text{ V}$, the reverse voltage V_D applied to the VCC diode is expressed by the following formula.

$$V_D = V_{CC(max)} + V_F + V_{IN(max)} \times \frac{N_D}{N_P}$$

This IC has VCC OVP function and VCC OVP (min) = 29.0 V.

Make sure that the reverse voltage of the diode does not exceed the V_D of the diode used even if the VCC voltage rises to VCC OVP.

Figure 14. IC peripheral circuit

$$V_D = 29.0\text{ V} + 1.0\text{ V} + 380\text{ V} \times \frac{15\text{ turns}}{105\text{ turns}} = 84.3\text{ V}$$

Select the 84.3 V / 0.7 120 V -> 400 V product taking into consideration the margin.

(Example ROHM RRE02VSM4S 400 V 0.2 A)

3.7 Surge voltage limiting resistor for VCC winding : R6

The transformer's leakage inductance (L_{leak}) generates a large surge voltage (spike noise) the moment the MOSFET is turned off. This surge voltage may be induced in the VCC winding, and the VCC voltage may rise to affect the VCC over voltage protection of the IC. Insert a limiting resistor R6 (about 5 to 22 Ω) to reduce the surge voltage induced in the VCC winding.

Regarding the rise of the VCC voltage, check it in the state of being incorporated in the product. This EVK, 10Ω was selected.

3.8 Capacitor for VCC : C10

The VCC capacitor C_{VCC} is required to stabilize the VCC voltage of the IC. The recommended capacity is 4.7 µF to 22 µF.

Figure 15 shows the relationship between start-up time and VCC capacitor value. This time, 10 µF / 35 V was selected.

Figure 15. Start-up Time(Reference)

3. Main parts selection – Continued

3.8 Capacitor for FB terminal : C9

C9 is a stabilization capacitor for the FB pin (1000 pF to 0.01 μF is recommended).

3.9 Snubber circuit : C11, R7, R8, D1

The transformer leakage inductance (L_{LEAK}) generates a large surge voltage (spike noise) the moment the MOSFET is turned off. This surge voltage is applied between the drain and source of the MOSFET, and in the worst case, the MOSFET may be destroyed. An RCD snubber circuit is recommended to suppress this surge voltage.

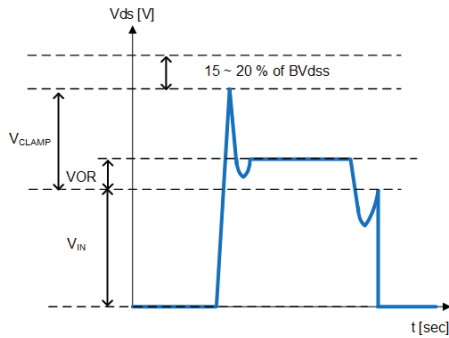

Figure 16. MOSFET Drain Voltage waveform

Figure 17. Snubber circuit

i. Determination of clamp voltage (V_{CLAMP}) and clamp Ripple voltage (V_{RIPPLE})

The clamp voltage is determined by taking into consideration the margin from the breakdown voltage of the MOSFET.

$$V_{CLAMP} = 650 V \times 0.8 = 520 V$$

Set the clamp ripple voltage (V_{RIPPLE}) to about 50 V.

ii. Determination of snubber resistance: R8

スナバ抵抗は、以下の条件を満たすように選定します。

$$R_8 < 2 \times V_{CLAMP} \times \frac{V_{CLAMP} - V_{OR}}{L_{LEAK} \times I_P^2 \times f_{SW}(max)}$$

Then, L_{LEAK} is 50 μH from the specification of the transformer.

The primary side peak current when $P_{OUT} = 48 W$, $V_{IN}(max) = 380 V$: I_{PPK} is calculated from the following formula.

First, calculate the on duty and off time t_{OFF} .

$$Duty = \frac{V_{OR}}{V_{IN}(max) + V_{OR}} = \frac{111.7 V}{380 V + 111.7 V} = 0.227$$

$$t_{OFF} = \frac{1 - Duty}{f_{SW}} = \frac{1 - 0.227}{65 kHz} = 11.89 [\mu s]$$

3.9 Snubber circuit - Continued

The secondary peak current I_{SSK} is expressed by the following formula. The load current at the time of overcurrent detection is the maximum load current $I_{OUT} (MAX)$: 2 A.

$$I_{SPK} = \frac{I_{OUT}(LIM)}{t_{OFF} \times f_{SW}} + \frac{1}{2} \times \frac{V_{OUT} + V_F}{L_S} \times t_{OFF} = \frac{2.0 A}{11.89 \mu s \times 65 kHz} + \frac{1}{2} \times \frac{24 V + 1.5 V}{62.69 \mu H} \times 11.89 \mu s = 5.01 [A]$$

The primary peak current I_{PPK} is expressed by the following formula.

$$I_{PPK} = I_{SPK} \times \frac{N_S}{N_P} = 5.01 A \times \frac{24}{105} = 1.15 [A]$$

Thus, the snubber resistance: R_8 is expressed by the following formula.

$$R_8 < 2 \times V_{CLAMP} \times \frac{V_{CLAMP} - V_{OR}}{L_{LEAK} \times I_{PPK}^2 \times f_{SW}(max)} = 2 \times 520 V \times \frac{520 V - 111.7 V}{50 \mu H \times 1.15^2 A \times 65 kHz} = 98.79 [k\Omega]$$

In fact, due to the influence of the MOSFET, not according to this equation, the snubber resistance of 47 k Ω is selected from actual device evaluation. Snubber resistance loss: P_{R_8} is expressed by the following formula.

$$P_{R_8} = \frac{(V_{CLAMP} - V_{IN})}{R_8} = \frac{(520 V - 380 V)^2}{47 k\Omega} = 0.42 [W]$$

Consider a margin and set it to 2 W or more.

iii. Determination of snubber capacitor: C10

The snubber capacitor is selected to meet the following conditions.

$$C_{10} > \frac{V_{CLAMP}}{V_{RIPPLE} \times f_{SW}(min) \times R_8} = \frac{540 V}{50 V \times 65 kHz \times 47 k\Omega} = 3.54 [nF]$$

The snubber capacitor is 10 nF. The voltage applied to C10 is 540 V-380 V = 160 V. considering to the margin and make it 200 V or more. This time, the 630 V withstand voltage is selected.

iv. Determination of snubber capacitor: D1

Use a fast recovery diode for the snubber diode. Make the breakdown voltage higher than the $V_{ds} (max)$ of the MOSFET. Surge voltage is affected by the pattern of the board as well as the transformer's leakage inductance. Check the V_{ds} voltage with the product incorporated, and adjust the snubber circuit as required.

3.10 Diode for output rectification : D4

Use a high speed diode (Schottky barrier diode, fast recovery diode) as the output rectification diode. Assuming that the reverse voltage applied to the output diode is $V_F = 1.5 \text{ V}$ and $V_{OUT} = 24.0 \text{ V}$, the reverse voltage V_D applied to the diode of D4 is expressed by the following formula.

$$V_D = V_{OUT} + V_F + V_{IN(max)} \times \frac{N_S}{N_P} = 24.0 \text{ V} + 1.5 \text{ V} + 380 \text{ V} \times \frac{24 \text{ turns}}{105 \text{ turns}} = 112.4 \text{ [V]}$$

Select a 200 V product considering the margin.

The current I_S (rms) flowing through the output diode is expressed by the following equation.

$$I_S(rms) = I_{SPK} \times \sqrt{\frac{1 - Duty}{3}} = 5.01 \text{ A} \times \sqrt{\frac{1 - 0.227}{3}} = 2.54 \text{ [A]}$$

This EVK, 20 A, 300 V, TO-220 package products was selected. (Example: ROHM RF2001T3DNZ) It is recommended to use voltage margin less than 70% and current less than 50%. Check the temperature rise with the product incorporated in the product, re-examine the parts if necessary, and dissipate the heat from the heat sink.

3.11 Capacitor for output : C12,C13,C14

The output capacitor is determined by the Peak-to-Peak ripple voltage (ΔV_{pp}) and the ripple current that are acceptable at the output load. When the MOSFET is on, the output diode is off. At this time, current is supplied from the output capacitor to the load. When the MOSFET is off, the output diode is on, charging the output capacitor and also providing the load current. Assuming that $\Delta V_{PP} = 200 \text{ mV}$ under the condition ($V_{IN} = 100 \text{ V}$, $P_{OUT} = 48 \text{ W}$) calculated by the transformer calculation,

$$Z_C < \frac{\Delta V_{PP}}{I_{SPK}} = \frac{200 \text{ mV}}{5.01 \text{ A}} = 39.9 \text{ [m}\Omega\text{]}$$

The impedance is specified at 100 kHz for general electrolytic capacitors for switching power supplies (low impedance products), so convert to 65 kHz.

$$Z_C < 39.9 \text{ m}\Omega \times \frac{65 \text{ kHz}}{100 \text{ kHz}} = 25.9 \text{ [m}\Omega\text{]}$$

Also, the ripple current I_C (rms) to the capacitor is expressed by the following formula.

$$I_C(rms) = \sqrt{I_S(rms)^2 - I_{OUT}^2} = \sqrt{2.54^2 - 2.00^2} = 1.57 \text{ [Arms]}$$

The withstand voltage of the capacitor should be 80% derating as a guide to the output voltage. $24 \text{ V} / 0.8 = 30 \text{ V}$ or more. This EVK time, low impedance type 35 V, 1000 μF for switching power supply, rated ripple current 1.89A : UPA1V102MPD: Nichicon. Check the actual Ripple voltage and Ripple current on the actual device.

Figure 18 Output peripheral circuit

3. Main parts selection - Continued

3.12 Output voltage setting resistor: R10,R11,R12

The output voltage is set by the following formula

$$V_{OUT} = \left(1 + \frac{R10 + R11}{R12}\right) \times V_{ref}$$

Set the feedback current I_{BIAS} flowing to R12 at 0.1 mA to 1.0 mA.

Assuming that $I_{BIAS} = 0.25$ mA, and the reference voltage

$V_{REF} = 2.485$ V of the shunt regulator IC2, the resistance value of R12 is

$$R12 = \frac{V_{REF}}{I_{BIAS}} = \frac{2.485\text{ V}}{0.25\text{ mA}} = 9.9\text{ [k}\Omega\text{]}$$

This EVK, select R12: 10 kΩ.

The combined resistance of the feedback resistors (R10 + R11 + R12) is

$$R10 + R11 + R12 = \frac{V_{OUT}}{I_{BIAS}} = \frac{24\text{ V}}{0.25\text{ mA}} = 96\text{ [k}\Omega\text{]}$$

This EVK, R10 = 82 kΩ and R11 = 4.7 kΩ are selected. The theoretical value of the output voltage is as follows.

$$V_{OUT} = \left(1 + \frac{82\text{ k}\Omega + 4.7\text{ k}\Omega}{10\text{ k}\Omega}\right) \times 2.485\text{ V} = 24.03\text{ V}$$

3.13 Control circuit adjustment: R13,R14,R15,C16

R14 is the dark current setting resistor for shunt regulator IC2. The current value I_{min} for stable operation of the shunt regulator is 1.2 mA according to the data sheet of the IC. This current is the combined current of R13 and the photo coupler's I_F . Since the voltage applied to R14 is the V_F of the photo coupler, assuming that the V_F of the photo coupler is 1.1 V,

$$R14 < \frac{V_F}{I_{min}} = \frac{1.1\text{ V}}{1.2\text{ mA}} = 0.92\text{ [k}\Omega\text{]}$$

This EVK, R14 = 1.0 kΩ is selected.

R13 is a control circuit current limiting resistor. Adjust with 300 to 2.2 kΩ.

This EVK, R13 = 1.0 kΩ is selected.

R15 and C16 are phase compensation circuits. Adjust with the actual board as R15 = 1 k to 30 kΩ, C16 = 0.1 μF or so.

Figure 19. Feed-back circuit

Design Overview – Continued

4 EMI measures

Check the following as EMI measures.

(*)The constant is a reference value. Adjust by the influence of noise.

•Input filter

Two common mode filters are used. The LF1 is used for the low frequency range, and the LF2 is used for the high frequency range.

Figure 20. Input filter circuit

•Capacitor between primary and secondary side (C4 : Y-Cap 2200 pF around)

•RC snubber circuit of secondary side rectification diode

An RC snubber circuit is added as a measure against radiated emissions.

Figure 21. RC snubber circuit of secondary side rectification diode
