BT817A Automotive Advanced Video **Engine Datasheet**

BT817A Bridaetek's 4th The is generation embedded video engine chip (EVE4) targeted at automotive applications to generate high-quality Human Machine Interfaces (HMIs). BT817A has the following features:

- Qualified for Automotive Applications
- Advanced Embedded Video Engine (EVE) with high resolution graphics and video playback
- Graphic control, audio control, and . touch control interface
- Supports multiple widgets for simplified design implementation
- Built-in graphics operations allow users with little expertise to create high-quality displays
- Supports Adaptive Scalable Texture Compression (ASTC) format to save considerable memory space for larger fonts and graphics images
- Supports external QSPI NOR flash up to 2Gbit to store and fetch graphic elements (image, font, widget etc.)
- Supports capacitive touch screen with up to 5 touch point detection
- Hardware engine can recognize touch tags and track touch movement. Provides notification for up to 255 touch tags
- Enhanced sketch processing
- Built-in 12MHz crystal oscillator with PLL providing programmable system clock up to 72MHz

- Video RGB parallel output; configurable to support PCLK up to 96MHz with separate PLL(PLL2), and R/G/B output of 1 to 8 bits (including RGB565, RGB666 and RGB888)
- Programmable timing to adjust HSYNC and VSYNC timing, enabling interfacing to numerous displays
- Support for LCD displays with up to 1 Mega pixel in total, and up to 2048 pixels per line
- Supported LCD resolutions: 1920x480, 1440×540 1280x800, 1024x600, 800x600, 800x480, 480x272, 320x240 and many others
- Supports landscape and portrait orientations
- High-guality cubic filter to output pixels to correct for panels with non-square pixels
- Adaptive framerate and Adaptive HSYNC modes
- Integrated 1MByte graphics RAM, no frame buffer RAM required
- Supports playback of motion-JPEG encoded AVI videos
- Mono audio channel output with Sigma-delta modulation
- Built-in sound synthesizer
- PWM output for display backlight dimming control
- Advanced object-oriented architecture enables low cost MPU/MCU as system host using SPI interfaces
- Supports SPI data lines in single, dual, or quad mode; SPI clock up to 30MHz
- Power mode control allows the chip to be put in power down, sleep, and standby states
- Supports I/O voltage from 1.8V to 3.3V (5V tolerant)
- Built-in Power-on-reset circuit
- AEC-Q100 Qualified with Device Temperature Grade 2: • -40°C to 105°C
- Available in a compact Pb-free, VQFN-64 package, RoHS compliant

1 Typical Applications

- vehicle instrument dashboard
- automotive smart display
- E-vehicle charging station

1.1 Part Numbers

Part Number	Description	Package				
BT817AQ-x	EVE4 with ASTC and external NOR flash,	64 Pin VQFN, body 9 x 9 mm, pitch				
DIOT/AQ-X	capacitive touch, automotive grade	0.5mm				
Table 1- BT817A Embedded Video Engine Part Numbers						

Note: Packaging codes for x is:

-R: Taped and Reel (2600 pcs per reel)

-T: Tray packing (260 pcs per tray)

For example: BT817AQ-R is 2600 VQFN pieces in taped and reel packaging

2 Block Diagram

3.2 Pin Description

Pin Number	Pin Name	Туре	Description
1	R0	0	Bit 0 of Red RGB signals Powered from pin VCCIO2
2	VCC1V2	Р	Digital core power supply input.
3	SCK	Ι	SPI clock input Powered from pin VCCIO1
4	MISO	I/O	SPI Single mode: SPI MISO output SPI Dual/Quad mode: SPI data line 1 Powered from pin VCCIO1
5	MOSI	I/O	SPI Single mode: SPI MOSI input

Pin Number	in Number Din Name Type Description				
Pin Number	Pin Name	Туре	Description SPI Dual/Quad mode: SPI data line 0		
			Powered from pin VCCIO1		
6	CS_N	I	SPI slave select input		
0	C5_N	1	Powered from pin VCCIO1		
7	GPIO0/IO2	I/O	SPI Single/Dual mode: General purpose IO 0 SPI Quad mode: SPI data line 2 Powered from pin VCCIO1		
8	GPIO1/IO3	I/O	SPI Single/Dual mode: General purpose IO 1 SPI Quad mode: SPI data line 3 Powered from pin VCCIO1		
9	VCCIO1	Р	I/O power supply for host interface pins. Support 1.8V, 2.5V or 3.3V.		
10	GPIO2	I/O	General purpose IO 2 Powered from pin VCCIO1		
11	INT_N	OD/ O	Interrupt to host, open drain output (default) or push-pull output, active low		
12	PD_N	I	Chip power down mode control input, active low. Connect to MCU GPIO for power management or hardware reset function or pulled up to VCCIO1 if not used. Powered from pin VCCIO1		
13	GPIO3	I/O	General purpose IO 3 Powered from pin VCCIO1		
14	SPIM_SCLK	0	SPI flash clock output line. Leave floating if not used. Powered from pin VCCIO3		
15	SPIM_SS_N	0	SPI flash chip select output line. Leave floating if not used. Powered from pin VCCIO3		
16	SPIM_MOSI	I/O	SPI flash MOSI line. Leave floating if not used. Powered from pin VCCIO3		
17	VCCIO3	Ρ	I/O power supply for SPIM pins. Support 1.8V, 2.5V or 3.3V. VCCIO3 can be connected to different voltage from VCCIO1 or VCCIO2.		
18	SPIM_MISO	I/O	SPI flash MISO line. Connect to GND if not used. Powered from pin VCCIO3		
19	SPIM_IO2	I/O	SPI flash IO2 line. Leave floating if not used. Powered from pin VCCIO3		
20	SPIM_IO3	I/O	SPI flash IO3 line. Leave floating if not used. Powered from pin VCCIO3		
21	X1/CLK	Ι	Crystal oscillator input 3.3V peak input allowed. Powered from pin VCC.		
22	X2	0	Crystal oscillator output Powered from pin VCC.		
23	GND	Р	Ground		
24	VCC	Р	3.3V power supply input.		
25	VCC1V2	Р	Digital core power supply input.		
26	AUDIO_L	0	Audio Sigma-delta output Powered from pin VCCA		
27	VCCA	Р	3.3V power supply input.		
28	VCCIO2	Р	I/O power supply for RGB and touch pins. Supports 1.8V, 2.5V or 3.3V. VCCIO2 can be connected to different voltage from VCCIO1 or VCCIO3.		
29	CTP_RST_N	0	Connect to reset pin of the CTPM. Powered from pin VCCIO2.

O : Output

OD : Open drain output I/O : Bi-direction Input and Output

AI/O: Analog Input and Output

4 Functional Description

The BT817A is a single chip embedded video controller with the following functional blocks:

- Quad SPI Host Interface
- Quad SPI Flash Interface
- System Clock
- Graphics Engine
- Parallel RGB video interface
- Audio Engine
- Touch-screen support and interface
- Power Management

The functions for each block are briefly described in the following subsections.

4.1 Quad SPI Host Interface

The BT817A uses a quad serial peripheral interface (QSPI) to communicate with host microcontrollers and microprocessors.

4.1.1 **QSPI Interface**

The QSPI slave interface operates up to 30MHz. Only SPI mode 0 is supported. Refer to section 6.4.2 for detailed timing specification. The QSPI can be configured as a SPI slave in SINGLE, DUAL or QUAD channel modes.

By default, the SPI slave operates in the SINGLE channel mode with MOSI as input from the master and MISO as output to the master. DUAL and QUAD channel modes can be configured through the SPI slave itself. To change the channel modes, write to register REG_SPI_WIDTH. The table below depicts the setting.

REG_SPI_ WIDTH [1:0]	Channel Mode	Data pins	Max bus speed
00	SINGLE – default mode	MISO, MOSI	30 MHz
01	DUAL	MOSI, MISO	30 MHz (not exceeding system clock frequency)
10	QUAD	MOSI, MISO, IO2, IO3	30 MHz (not exceeding half of the system clock frequency)
11	Reserved	-	-

Table 4-1 QSPI Channel Selection

With DUAL/QUAD channel modes, the SPI data ports are now unidirectional. In these modes, each SPI transaction (signified by CS_N going active low) will begin with the data ports set as inputs. Hence, for writing to the BT817A, the protocol will operate as in previous EVE revisions such as the FT800, with "WR-Command/Addr2, Addr1, Addr0, DataX, DataY, DataZ ..." The write operation is considered complete when CS_N goes inactive high. For reading from the BT817A, the protocol will still operate as in FT800, with "RD-Command/Addr2, Addr1, Addr0, Dummy-Byte, DataX, DataY, DataZ". However, as the data ports are now unidirectional, a change of port direction will occur before DataX is clocked out of the BT817A. Therefore, it is important that the firmware controlling the SPI master changes the SPI master data port direction to "input" after transmitting Addr0. The BT817A will not change the port direction till it starts to clock out DataX. Hence, the Dummy-Byte cycles will be used as a change-over period when neither the SPI master nor slave will be driving the bus; the data paths thus must have pull-ups/pull-downs. The SPI slave from the BT817A will reset all its data ports' direction to input once CS_N goes inactive high (i.e., at the end of the current SPI master transaction).

Figure 4-1 depicts the behaviour of both the SPI master and slave in the master read case.

Figure 4-1 SPI Master and Slave in the Master Read Case

In the DUAL channel mode, MISO (MSB) and MOSI are used while in the QUAD channel mode. IO3 (MSB), IO2, MISO and MOSI are used.

Figure 4-2 illustrates a direct connection to a 1.8-3.3V IO MPU/MCU with single or dual SPI interface.

Figure 4-3 illustrates a direct connection to a 1.8-3.3V IO MPU/MCU with Quad SPI interface.

Figure 4-2 Single/Dual SPI Interface connection

4.1.2 Serial Data Protocol

The BT817A appears to the host MPU/MCU as a memory-mapped SPI device. The host communicates with the BT817A using reads and writes to a large (4 megabyte) address space. Within this address space are dedicated areas for graphics, audio, and touch control. Refer to section 5 for the detailed memory map. The host reads and writes the BT817A address space using SPI transactions. These transactions are memory read, memory write, and command write. Serial data is sent by the most significant bit first. Each transaction starts with CS_N goes low and ends when CS_N goes high. There is no limit on data length within one transaction, as long as the memory address is continuous.

4.1.3 Host Memory Read

For SPI memory read transactions, the host sends two zero bits, followed by the 22-bit address. This is followed by a dummy byte. After the dummy byte, the BT817A responds to each host byte with read data bytes.

4.1.4 Host Memory Write

For SPI memory write transactions, the host sends a `1' bit and `0' bit, followed by the 22-bit address. This is followed by the write data.

Table 4-3 Host Memory Write Transaction

4.1.5 Host Command

When sending a command, the host transmits a 3-byte command. Table 4-5 lists all the host command functions.

For SPI command transactions, the host sends a '0' bit and '1' bit, followed by the 6-bit command code. The 2nd byte can be either 00h, or the parameter of that command. The 3rd byte is fixed at 00h.

All SPI commands except the system reset can only be executed when the SPI is in the Single channel mode. They will be ignored when the SPI is in either Dual or Quad channel mode.

Some commands are used to configure the device and these configurations will be reset upon receiving the SPI PWRDOWN command, except those that configure the pin state during power down. These commands will be sticky unless reconfigured or power-on-reset (POR) occurs.

7	6	5	4	3	2	1	0			
0	1		Command [5:0]							
Parameter for the command										
0	0	0	0	0	0	0	0	3 rd Byte		

Table 4-4 Host Command Transaction

1st Byte	2nd byte	3rd byte	Command	Description				
	Power Modes							
00000000b	00000000b	00000000b	00h ACTIVE	Switch from Standby/Sleep/PWRDOWN modes to active mode. Dummy memory read from address 0(read twice) generates ACTIVE command.				
01000001b	00000000b	00000000b	41h STANDBY	Put BT817A core to standby mode. Clock gate off, PLL and Oscillator remain on. ACTIVE command to wake up.				
01000010b	00000000b	00000000b	42h SLEEP	Put BT817A core to sleep mode. Clock gate off, PLL and Oscillator off. ACTIVE command to wake up.				

1st Byte	2nd byte	3rd byte	Command	Description		
		J. 4 5 7 6	connand	Switch off power supply to the digital		
01000011b 01010000b	00000000b	00000000b	43h/50h PWRDOWN	core circuits. Clock, PLL and Oscillator off. SPI is alive. ACTIVE command to wake up.		
			et			
01000100b	00000000b	00000000b	44h CLKEXT	Select PLL input from external crystal oscillator. No effect if external clock is already selected, otherwise a system reset will be generated		
01100001b 01100010b	Xx	0000000b	61h/62h CLKSEL	Select the system clock frequency. Note that software shall also update the register value for REG_FREQUENCY to align with system clock selected. This command will only be effective when the PLL is stopped (SLEEP mode). For compatibility to FT800/FT801, set Byte2 to 0x00. This will set the PLL clock back to default (60 MHz).Byte2sets the clock frequency [5:0]0Set to default clock speed1Reserved2 to 62 to 6 times the osc frequency (i.e., 24 to 72MHz with 12MHz oscillator)Byte2sets the PLL range0When Byte2[5:0] = 0, 2, 31When Byte2[5:0] = 4, 5, 6		
01101000b	00000000b	00000000b	68h RST_PULSE	Send reset pulse to BT817A core. The behaviour is the same as POR except those settings done through SPI commands will not be affected		
			Configuration	1		
01110000Ь	xx	0000000b	70h PINDRIVE	This will set the drive strength for various pins. For FT800/FT80 compatibility, by default those setting are from the GPIO registers. BT817 supports setting the drive strength vi SPI command instead. When PINDRIVE for a pin from the SP command is not updated, the driv strength will be determined by it corresponding GPIO register bits if the exist. If they do not exist, a hard code setting is used. Please refer to Tabl 4-22 for default values. When PINDRIVE for a pin from the SP command is updated, it will override th corresponding setting in the GPIO register bits. Byte2 determines which pin and whice

4.1.6 Interrupts

The interrupt output pin is enabled by REG_INT_EN. When REG_INT_EN is 0, INT_N is tri-state (pulled to high by external pull-up resistor). When REG_INT_EN is 1, INT_N is driven low when any of the interrupt flags in REG_INT_FLAGS are high, after masking with REG_INT_MASK. Writing a '1' in any bit of REG_INT_MASK will enable the corresponding interrupt. Each bit in REG_INT_FLAGS is set by a corresponding interrupt source. REG_INT_FLAGS is readable by the host at any time and clears when read.

The INT_N pin is open-drain (OD) output by default. It can be configured to push-pull output by register REG_GPIOX.

Bit	Interrupt Source	Conditions
0	INT_SWAP	Display list swap occurred
1	INT_TOUCH	touch detected
2	INT_TAG	Touch-screen tag value change
3	INT_SOUND	Sound effect ended
4	INT_PLAYBACK	Audio playback ended
5	INT_CMDEMPTY	Command FIFO empty
6	INT_CMDFLAG	Command FIFO flag
7	INT_CONV_COMPLETE	Touch-screen conversions completed
8	INT_UNDERRUN	Graphics pipeline underrun

Table 4-6 Interrupt Flags bit assignment

4.2 System Clock

4.2.1 Clock Source

The BT817A supports external 12MHz crystal as clock source for system clock and RGB interface pixel clock.

Figure 4-4 shows the pin connections for the crystal.

Figure 4-4 Crystal Oscillator Connection

4.2.2 Phase Locked Loop

There are 2 PLLs inside the chip, system PLL(PLL1) and PCLK PLL(PLL2).

The system PLL takes an input clock from the oscillator, and generates clocks to all internal circuits, including the graphics engine, audio engine and touch engine.

The PCLK PLL (PLL2) takes an input clock from the oscillator and generates clocks for RGB interface when configured in Exsync mode.

4.2.3 Clock Enable

At power-on the BT817A is in sleep mode. The system clock will be enabled when the following step is executed:

- Host sends a "CLKEXT" command
- Host sends an "ACTIVE" command

4.2.4 Clock Frequency

By default, the system clock is running at 60MHz when the input clock is 12MHz. The host is allowed to switch the system clock to other frequencies by the host command "CLKSEL". The clock switching command shall be sent in SLEEP mode only.

After the chip is put into Active mode, software shall update the REG_FREQUENCY value to align with the chosen system clock frequency by CLKSEL command, if the default 60MHz is changed.

4.3 Graphics Engine

4.3.1 Introduction

The graphics engine executes the display list once for every horizontal line. It executes the primitive objects in the display list and constructs the display line buffer. The horizontal pixel content in the line buffer is updated if the object is visible at the horizontal line.

Key features of the graphics engine are:

- The primitive objects supported by the graphics processor are lines, points, rectangles, bitmaps (comprehensive set of formats), text display, plotting bar graph, edge strips, and line strips, etc.
- Operations such as stencil test, alpha blending and masking are useful for creating a rich set of effects such as shadows, transitions, reveals, fades, and wipes.
- Anti-aliasing of the primitive objects (except bitmaps) gives a smoothing effect to the viewer.
- Bitmap transformations enable operations such as translate, scale, and rotate.
- Display pixels are plotted with 1/16th pixel precision.
- Four levels of graphics states
- Tag buffer detection

The graphics engine also supports customized built-in widgets and functionalities such as ASTC decode, jpeg decode, screen saver, calibration etc. The graphics engine interprets commands from the MPU host via a 4 Kbyte FIFO in the BT817A memory at RAM_CMD. The MPU/MCU writes commands into the FIFO, and the graphics engine reads and executes the commands. The MPU/MCU updates the register REG_CMD_WRITE to indicate that there are new commands in the FIFO, and the graphics engine updates REG_CMD_READ after commands have been executed.

Key features supported are:

- Drawing of widgets such as buttons, clock, keys, gauges, text displays, progress bars, sliders, toggle switches, dials, gradients, etc.
- JPEG and motion-JPEG decode
- Inflate functionality (zlib inflate is supported)
- Timed interrupt (generate an interrupt to the host processor after a specified number of milliseconds)
- In-built animated functionalities such as displaying logo, calibration, spinner, screen saver and sketch
- Snapshot feature to capture the current graphics display

For a complete list of graphics engine display commands and widgets refer to <u>BT81X Series Programming Guide</u>, Chapter 4.

4.3.2 ASTC

ASTC stands for **A**daptive **S**calable **T**exture **C**ompression, an open standard developed by ARM for use in mobile GPUs.

ASTC is a block-based lossy compression format. The compressed image is divided into a number of blocks of uniform size, which makes it possible to quickly determine which block a given texel (unit of a texture map) resides in. Each block has a fixed memory footprint of 128 bits, but these bits can represent varying numbers of texels (the block footprint).

Block footprint sizes are not confined to powers-of-two and are also not confined to be square. For 2D formats the block dimensions range from 4 to 12 texels.

Using ASTC for the large ROM fonts can save considerable space. Encoding the four largest fonts in ASTC 8x8 formats gives no noticeable loss in quality and reduces the ROM size from 1 Mbytes to about 640 Kbytes.

4.3.3 ROM and RAM Fonts

The BT817A has built in ROM character bitmaps as font metrics. The graphics engine can use these metrics when drawing text fonts. There are a total of 19 ROM fonts, numbered with font handle 16-34. Fonts 31-34 are large ROM fonts encoded in ASTC 8x8 format. The user can define and load customized font metrics into RAM_G or external flash, making it possible to support a full range of Unicode characters with UTF-8 coding points.

Each ROM font metric block has a 148-byte font table which defines the parameters of the font and the pointer of font image. The font table format is shown in Table 4-7.

Address Offset	Size(byte)	Parameter Description							
0	128	width of each font character, in pixels							
128	4	font bitmap format, for example L1, L4 or L8							
132	4	font line stride, in bytes							
136	4	font width, in pixels							
140	4	font height, in pixels							
144	4	pointer to font image data in memory							
Table 4.7 Fort Table Format									

Table 4-7 Font Table Format

The ROM fonts are stored in the memory space ROM_FONT. The ROM font table is also stored in the ROM. The starting address of the ROM font table for font index 16 is stored at ROM_FONT_ADDR, with other font tables following. The ROM font table and individual character width (in pixel) are listed in Table 4-8, Table 4-9 and Table 4-10. Font index 16, 18 and 20-31 are for basic ASCII characters (code 0-127), while font index 17 and 19 are for Extended ASCII characters (code 128-255). The character width for font index 16 through 19 is fixed at 8 pixels for any of the ASCII characters.

Font Index	1 6	1 7	1 8	1 9	2 0	2 1	2 2	2 3	2 4	2 5	2 6	2 7	2 8	2 9	3 0	3 1	3 2	3 3	3 4

Table 4-10 ROM Font Extended ASCII Characters

Note 1: Font 17 and 19 are extended ASCII characters, with width fixed at 8 pixels for all characters.

Note 2: All fonts included in the BT817A ROM are widely available to the market-place for general usage.

4.4 SPI NOR Flash Interface

The BT817A implements a SPI master to connect to external SPI NOR Flash. Graphics assets such as Unicode fonts and images can be stored in the flash memory. The BT817A graphics engine can fetch these graphics assets directly without going through external host MCU, thus significantly offloading the host MCU from feeding display contents.

The BT817A supports various NOR flash memory device from different vendors such as Cypress, Macronix, Winbond, Micron, ISSI and Gigadevice. The flash shall support XIP operation. The interface will work at system clock speed at 4-bit mode, providing the maximum data read throughput of 288 Mbit/s.

Figure 4-5 Flash Interface States

The register REG_FLASH_STATE indicates the state of the flash subsystem. At boot, the flash state is FLASH_STATE_INIT. After detection has completed flash is in state FLASH_STATE_DETACHED or FLASH_STATE_BASIC, depending on whether an attached flash device was detected.

If no device is detected, then all SPIM signals are driven to low or high, except SPIM_MISO which is Hi- Z.

When the host MCU calls CMD_FLASHFAST, the flash system attempts to go to full-speed mode, setting state to FLASH_STATE_FULL (Note: the 4K byte flash blob file needs to program to the flash before the flash can enter full-speed mode).

At any time, the user can call CMD_FLASHDETACH in order to disable flash communications. In the detached state, commands CMD_FLASHSPIDESEL, CMD_FLASHSPITX and CMD_FLASHSPIRX can be used to control the SPI bus.

If detached, the host MCU can call CMD_FLASHATTACH to re-establish communication with the flash device.

Direct rendering of bitmaps from flash is only possible in FLASH_STATE_FULL. After modifying the contents of flash, the MCU should clear the on-chip bitmap cache by calling CMD_CLEARCACHE.

If the flash is blank (or erased using the CMD_FLASHERASE), it is recommended to use CMD_FLASHPROGRAM to program the flash in order to achieve fastest programming speed. For Micron MT25QL and Cypress S25FL-L series NOR flash, typical programming speed is about 900 kByte/s (assume host SPI clock set at 10MHz or higher in Single SPI mode).

4.5 Parallel RGB Interface

The RGB parallel interface consists of 29 signals - DISP, PCLK, VSYNC, HSYNC, DE, 8 signals each for R, G and B.

A set of RGB registers configure the LCD operation and timing parameters.

REG_PCLK is used to select the display mode and clock divisor. The default value is 0, which means the display scanout is disabled and all RGB signals output Low.

When REG_PCLK is set to 1, the display output will be in EXTSYNC mode, where the PCLK frequency is controlled by REG_PCLK_FREQ from PLL2. The maximum PLL2 frequency is 228MHz. The PCLK frequency can be set up to 96MHz to align with the optimized PCLK frequency of the selected LCD

panel. If PCLK frequency is equal to or higher than system clock frequency (up to double the system clock frequency), the REG_PCLK_2X needs to be 1 so that the graphics engine can send two pixels per system clock to the EXTSYNC block. Note that in this 2X mode, the values loaded in the following registers must be even: REG_HSIZE, REG_HOFFSET, REG_HCYCLE, REG_HSYNC0, REG_HSYNC1.

The PCLK frequency in EXTSYNC mode can be calculated as:

PLL2 frequency = 12MHz * REG_PCLK_FREQ[9:4] PCLK frequency = PLL2 frequency / REG_PCLK_FREQ[3:0] / 2

REG_PCLK_FREQ[11:10] is determined by PLL2 frequency range:

00: 20 - 40 MHz 01: 40 - 80 MHz 10: 80 - 160 MHz 11: 160 - 228 MHz

<u>Important Note:</u> The user must always ensure that the PLL2 frequency does not exceed the limit of 228MHz and that the PCLK frequency does not exceed 96MHz. It is recommended to use these values from Table 4-11 when setting the register.

Table 4-11 lists some of the valid PCLK frequency and REG_PCLK_FREQ values in EXTSYNC mode.

fpclk (MHz)	REG_PCLK_ FREQ (hex)								
96	D01	51	D12	32	D03	22	8B3	10.5	874
90	CF1	48	881	30	451	21	872	10	453

54	891	33	8B2	22.5	CF4	12	21	3	24

Table 4-11 RGB PCLK Frequency in EXTSYNC mode

When REG_PCLK is set to 2 to 255, the display out is in pass-through mode, where the PCLK frequency can be calculated as:

PCLK frequency = System Clock frequency / REG_PCLK

The BT817A system clock frequency is programmable. Some of the possible PCLK frequencies that BT817A supports in pass-through mode are listed in Table 4-12.

		System	Clock Frequency	y (MHz)	
REG_PCLK	72	60(default)	48	36	24
2	36	30	24	18	12
3	24	20	16	12	8.0
4	18	15	12	9.0	6.0
5	14.5	12	9.6	7.2	4.8
6	12	10	8.0	6.0	4.0
7	10.3	8.6	6.9	5.1	3.4
8	9	7.5	6.0	4.5	3.0
9	8	6.7	5.3	4.0	2.7
10	7.2	6.0	4.8	3.6	2.4

Table 4-12 RGB PCLK Frequency in Pass-Through mode

 $\mathsf{REG}_\mathsf{PCLK}_\mathsf{POL}$ defines the clock polarity, with 0 for LCD display with positive active clock edge, and 1 for LCD display with negative active clock edge.

REG_CSPREAD controls the transition of RGB signals with respect to the PCLK active clock edge. When REG_CSPREAD=0, R[7:0], G[7:0] and B[7:0] signals change following the active edge of PCLK. When REG_CSPREAD=1, R[7:0] changes a PCLK clock early and B[7:0] a PCLK clock later, which helps reduce the switching noise.

REG_DITHER enables colour dither. To improve image quality, the graphics engine applies a 2x2 color dither matrix to output pixels. This option improves the half-tone appearance on displays, even on 1-bit displays. Note that the dither function is not applicable to 2X mode (REG_PCLK_2X=1).

REG_OUTBITS gives the bit width of each colour channel. The default is 8/8/8 bits for each R/G/B colour, giving total colour depth of 16,777,216 colours. A lower value means fewer bits are output for that colour channel, allowing dithering on lower precision LCD displays. A typical lower precision LCD has 6/6/6 bits for each R/G/B colour, giving total colour depth of 262,144 colours. For 6/6/6 bits configuration, pins R2-R7, G2-G7 and B2-B7 will be used, while pins R0,R1,G0,G1,B0,B1 can be left un-connected.

REG_SWIZZLE controls the arrangement of the output colour pins, to help PCB routing with different LCD panel arrangements. Bit 0 of the register causes the order of bits in each colour channel to be reversed. Bits 1-3 control the RGB order. Setting Bit 1 causes R and B channels to be swapped. Setting Bit 3 allows rotation to be enabled. If Bit 3 is set, then (R, G, B) is rotated right if bit 2 is one or left if bit 2 is zero.

REC	REG_SWIZZLE			RGB PINS

Table 4-13 REG_SWIZZLE RGB Pins Mapping

REG_HCYCLE, REG_HSIZE, REG_HOFFSET, REG_HSYNC0 and REG_HSYNC1 define the LCD horizontal timings. Each register has 12 bits to allow programmable range of 0-4095 PCLK cycles. REG_VCYCLE, REG_VSIZE, REG_VOFFSET, REG_VSYNC0 and REG_VSYNC1 define the LCD vertical timings. Each register has 12 bits to allow a programmable range of 0-4095 lines.

	Register	Display Parameter	Description	
	REG_HCYCLE	Т _н	Total length of line (visible and non-visible) (in PCLKs)	
_	REG_HSIZE	T _{HD}	Length of visible part of line (in PCLKs)	
Horizontal	REG_HOFFSET	$T_{HF} + T_{HP} + T_{HB}$	Length of non-visible part of line. Must be $< T_H$ -	
izo			T _{HD}	
łor			(in PCLK cycles)	
<u> </u>	REG_HSYNC0 T _{HF}		Horizontal Front Porch (in PCLK cycles)

Table 4-14 Registers for RGB Horizontal and Vertical Timings

When setting the display registers, ensure that the following conditions are met:

HOFFSET < (HCYCLE - HSIZE)

VOFFSET < (VCYCLE - VSIZE)

Figure 4-6 RGB Timing Waveforms

BT817A supports adaptive HSYNC and adaptive framerate operations. In adaptive HSYNC mode the graphics engine may delay the start of the scanout line up to the cycle count given in REG_AH_HCYCLE_MAX, while keeping PCLK running. Adaptive HSYNC is enabled when REG_AH_HCYCLE_MAX is set to a non-zero value between REG_HCYCLE and 4095. In adaptive framerate mode the graphics engine may suspend PLCK if the next scanout line is not ready. Note that some displays (for example displays with LVDS interface) may not support PCLK varying or pausing. If not supported, disable adaptive framerate via register REG_ADAPTIVE_FRAMERATE.

BT817A supports Horizontal Scanout Filter (HSF) operation. The HSF applies a high-quality filter to output pixels, correcting for LCD panels with non-square pixels (the physical size of the LCD pixel is not square). HSF is enabled and disabled with CMD_HSF. Note that HSF and 2X are not supported together.

Table 4-15 lists all the supported display modes for the RGB interface.

Table 4-15 Display mode

4.6 Miscellaneous Control

4.6.1 Backlight Control Pin

The backlight dimming control pin (BACKLIGHT) is a Pulse-width Modulation (PWM) signal controlled by two registers: *REG_PWM_HZ* and *REG_PWM_DUTY*. REG_PWM_HZ specifies the PWM output frequency, the range is 250-10000 Hz. REG_PWM_DUTY specifies the duty cycle; the range is 0-128. A value of 0 means that the PWM is completely off and 128 means completely on.

The BACKLIGHT pin will output low when the DISP pin is not enabled (i.e., logic 0).

4.6.2 DISP Control Pin

The DISP pin is a general-purpose output that can be used to enable or reset the LCD display panel. The pin is controlled by writing to Bit 7 of the REG_GPIO register, or bit 15 of REG_GPIOX.

4.6.3 General Purpose IO pins

The BT817A can be configured to use up to 4 GPIO pins. These GPIO pins are controlled by the REG_GPIOX_DIR and REG_GPIOX registers. Alternatively, the GPIO0 and GPIO1 pins can also be controlled by REG_GPIO_DIR and REG_GPIO to maintain backward compatibility with the FT800/FT801.

When the QSPI is enabled in Quad mode, GPIO0/IO2 and GPIO1/IO3 pins are used as data lines of the QSPI.

4.6.4 Pins Drive Current Control

The output drive current of output pins can be changed as per the following table by writing to bit[6:2] of REG_GPIO register or bit[14:10] of REG_GPIOX register. Alternatively, use the SPI command PINDRIVE to change the individual pin drive strength.

REG_GPIO	Bit[6:5]			Bit	[4]		Bit[3:2]		
REG_GPIOX	Bit[14:13]		Bit[12]		Bit[11:10]

4.7 Audio Engine

BT817A provides mono audio output with sigma-delta modulation through a digital output pin, AUDIO_L. It outputs two audio sources, the sound synthesizer and audio file playback.

4.7.1 Sound Synthesizer

A sound processor, AUDIO ENGINE, generates the sound effects from a small ROM library of waves table. To play a sound effect listed in Table 4.3, load the REG_SOUND register with a code value and write 1 to the REG_PLAY register. The REG_PLAY register reads 1 while the effect is playing and returns a '0' when the effect ends. Some sound effects play continuously until interrupted or instructed to play the next sound effect. To interrupt an effect, write a new value to REG_SOUND and REG_PLAY registers; e.g., write 0 (Silence) to REG_SOUND and 1 to PEG_PLAY to stop the sound effect. Note that the audio engine will automatically start upon chip boot up, and the AUDIO_L pin will output a carrier signal at a frequency equal to half of the system clock. To avoid the carrier wave being output on the pin when audio is not used, play the mute sound (write 0x60 to REG_SOUND and 1 to REG_PLAY). The AUDIO_L pin will then output a logic low level.

The sound volume is controlled by register REG_VOL_SOUND. The 16-bit REG_SOUND register takes an 8-bit sound in the low byte. For some sounds, marked "pitch adjust" in the table below, the high 8 bits contain a MIDI note value. For these sounds, a note value of zero indicates middle C. For other sounds, the high byte of REG_SOUND is ignored.

Table 4-18 MIDI Note Effect

4.7.2 Audio Playback

The BT817A can play back recorded sound through its audio output. To do this, load the original sound data into the BT817A's RAM, and set registers to start the playback.

The registers controlling audio playback are:

gisters controlling dudie playbac	
REG_PLAYBACK_START:	the start address of the audio data
REG_PLAYBACK_LENGTH:	the length of the audio data, in bytes
REG_PLAYBACK_FREQ:	the playback sampling frequency, in Hz
REG_PLAYBACK_FORMAT:	the playback format, one of LINEAR SAMPLES, uLAW
	SAMPLES, or ADPCM SAMPLES
REG_PLAYBACK_LOOP:	if zero, the sample is played once. If one, the sample is
repeated	indefinitely
RÉG_PLAYBACK_PLAY:	a write to this location triggers the start of audio playback, regardless of writing '0' or '1'. Read back '1' when playback is ongoing, and '0' when playback finishes
REG_VOL_PB:	playback volume, 0-255

The mono audio formats supported are 8-bits PCM, 8-bits uLAW and 4-bits IMA-ADPCM. For ADPCM_SAMPLES, each sample is 4 bits, so two samples are packed per byte, the first sample is in bits 0-3 and the second is in bits 4-7.

The current audio playback read pointer can be queried by reading the REG_PLAYBACK_READPTR. Using a large sample buffer, looping, and this read pointer, the host MPU/MCU can supply a continuous stream of audio.

4.8 Touch-Screen Engine

The BT817A touch-screen engine supports capacitive touch panels.

4.8.1 Capacitive Touch Control

The Capacitive Touch Screen Engine (CTSE) of the BT817A communicates with the external capacitive touch panel module (CTPM) through an I²C interface. The CTPM will assert its interrupt line when there is a touch detected. Upon detecting CTP_INT_N line active, the BT817A will read the touch data through I²C. Up to 5 touches can be reported and stored in BT817 registers. The BT817 built-in ROM code supports Focaltech, Hycontek and Goodix touch controllers, as well as touch host mode (refer to section 4.8.5). For a supported CTPM list please refer to <u>AN 336 FT8xx - Selecting an LCD Display</u>. For other touch controller IC, consult Bridgetek.

The BT817A uses the I2C address value in the REG_TOUCH_CONFIG register to differentiate Focaltech/Hycontek and Goodix touch controllers. For Focaltech/Hycontek IC the I2C address must be set as 0x38-0x3F (example: REG_TOUCH_CONFIG = 0x0380), while for Goodix IC the I2C address must be set as 0x5D (example: REG_TOUCH_CONFIG = 0x05D0). The touch engine requires a reset if changing I2C address from default value, as shown below:

Write REG_CPURESET = 2 Write REG_TOUCH_CONFIG = 0x05D0 Write REG_CPURESET = 0

//For Goodix touch controller

The BT817A supports I2C clock stretch. This is particularly useful for supporting Hycontek touch IC.

Figure 4-7 Touch Screen Connection

The host controls the CTSE operation mode by writing the REG_CTOUCH_MODE.

REG_CTOUCH_MODE	Mode	Description
0	OFF	Acquisition stopped
1-2	Reserved	Reserved
3	CONTINUOUS Perform acquisition continuously at the reporting rate of the	
		connected CTPM.

Table 4-19 Capacitive Touch Controller Operating Mode

The BT817A CTSE supports compatibility mode and extended mode. By default, the CTSE runs in compatibility mode. In extended mode, the touch register meanings are modified, and a second set of registers are exposed. These allow multi-touch detection (up to 5 touches).

4.8.2 Compatibility Mode

The CTSE reads the X and Y coordinates from the CTPM and writes to register REG_CTOUCH_RAW_XY. If the touch screen is not being pressed, both registers read 65535 (FFFFh). These touch values are transformed into screen coordinates using the matrix in registers REG_CTOUCH_TRANSFORM_A-F. The post-transform coordinates are available in register REG_CTOUCH_SCREEN_XY. If the touch screen is not being pressed, both registers read -32768 (8000h). The values for REG_CTOUCH_TRANSFORM_A-F may be computed using an on-screen calibration process.

If the screen is being touched, the screen coordinates are looked up in the screen's tag buffer, delivering a final 8-bit tag value, in REG_TOUCH_TAG. Because the tag lookup takes a full frame, and touch coordinates change continuously, the original (x; y) used for the tag lookup is also available in REG_TOUCH_TAG_XY.

4.8.3 Extended Mode

Setting REG_CTOUCH_EXTENDED to 1b'0 enables extended mode. In extended mode a new set of readout registers are available, allowing gestures and up to five touches to be read. There are two classes of registers: control registers and status registers. Control registers are written by the MCU. Status registers can be read out by the MCU and the BT817A's hardware tag system.

The five touch coordinates are packed in REG_CTOUCH_TOUCH0_XY, REG_CTOUCH_TOUCH1_XY, REG_CTOUCH_TOUCH2_XY, REG_CTOUCH3_XY, REG_CTOUCH4_X and REG_CTOUCH4_Y.

Coordinates stored in these registers are signed 16-bit values, so have a range of -32768 to 32767. The no-touch condition is indicated by x=y=-32768. These coordinates are already transformed into screen coordinates based on the raw data read from the CTPM, using the matrix in registers REG_CTOUCH_TRANSFORM_A-F. To obtain raw (x,y) coordinates read from CTPM, the user sets the REG_CTOUCH_TRANSFORM_A-F registers to the identity matrix.

The BT817A tag mechanism is implemented by hardware, where up to 5 tags can be looked up.

In touch extended mode, the INT_TOUCH bit in REG_INT_FLAG register will not be set upon touch down event. It is recommended to use INT_CONV_COMPLETE bit instead.

4.8.4 Capacitive Touch Configuration

On a capacitive touch system some users may need to adjust the CTPM default values, such as the registers affecting touch sensitivity. To do this the following sequence shall be executed once after chip reset:

- Hold the touch engine in reset (set REG_CPURESET = 2)
- Write the CTPM configure register address and value to the BT817A designated memory location
- Up to 10 register address/value can be added
- Release the touch engine reset (set REG_CPURESET = 0)

Sample codes are listed below for configuring Focaltech touch controller:

#define FW_RD(a) VC.rd16(RAM_JTBOOT + 2 * (a))
#define FW_WR(a, v) VC.wr16(RAM_JTBOOT + 2 * (a), (v))

void init_custom_touch(size_t num_regs, uint8_t *reg_value)

```
{
    while (VC.rd(REG_CPURESET) != 0)
```

VC.wr(REG_CPURESET, 2);

```
uint16_t main = FW_RD(0) & 0xfff;
uint16_t i_set = 0x4000 | (main - 4);
uint16_t patch = main + 1;
uint16_t i_eol = FW_RD(patch);
while (num_regs--) {
    uint8_t reg = *reg_value++;
    uint8_t val = *reg_value++;
    FW_WR(patch++, 0x8000 | val);
    FW_WR(patch++, i_set);
}
FW_WR(patch, i_eol);
```

VC.wr(REG_CPURESET, 0);

The CTPM can be enabled in low power state when the touch function is not required by the application. Setting the low-power bit in REG_TOUCH_CONFIG will enable the low power mode of the CTPM. When the low-power bit is cleared, the BT817A touch engine will send a reset to the CTPM, thus re-enabling the touch detection function.

4.8.5 Host Driven Multi-Touch

If the host MCU can provide touch inputs, it can supply them directly to the BT817A using touch host mode. By using touch host mode, an application can choose to select a touch controller that is not in the BT817A direct support list. For example, Touch Host mode would allow controllers to be used from other manufacturers beyond Focaltech and Goodix.

To use the touch host mode, the host MCU shall be connected to the touch panel directly. The four touch related pins of the BT817A can be left unconnected on the PCB. The host MCU is responsible for communicating with the touch controller, fetching the touch data when reported, and writing the touch data to the BT817A for touch TAG lookup and reporting.

The touch host mode can be entered by setting bit 14 in register REG_TOUCH_CONFIG and resetting the touch engine:

- Hold the touch engine in reset (set REG_CPURESET = 2)
- Write 1 to bit 14 in REG_TOUCH_CONFIG (set REG_TOUCH_CONFIG = 0x4000)
- Release the touch engine reset (set REG_CPURESET = 0)

In touch host mode, the host supplies touch information via four registers:

BT817	Register Name	Bits	Description
address			

Document No.: BRT_000251 Clearance No.: BRT#194

	0x30210c	REG_EHOST_TOUCH_X	Unsigned 16-bit	Touch x coordinate
	0x302118	REG_EHOST_TOUCH_Y	Unsigned 16-bit	Touch y coordinate
Ì	0x302114	REG_EHOST_TOUCH_ID	4-bit	Touch ID / phase
ĺ	0x302170	REG_EHOST_TOUCH_ACK	4-bit	Acknowledgement
	T 11 4 20 Deviateurs few Texask II.e et Meide			

Table 4-20 Registers for Touch Host Mode

The host writes raw (x; y) coordinates and IDs to the above registers. Up to 5 touches can be set, using touch IDs 0-4. The host indicates no touch by supplying coordinates (0x8000; 0x8000). When the host writes 0xf to the ID register, BT817A sets the ACK register to 0, transforms all the raw coordinates, and writes the results to the regular touch registers.

Pseudocode:

wait until REG_EHOST_TOUCH_ACK is 1 for each touch:

write x coordinate to REG_EHOST_TOUCH_X write y coordinate to REG_EHOST_TOUCH_Y write id to REG_EHOST_TOUCH_ID write 0xf to REG_EHOST_TOUCH_ID

As soon as BT817A has converted the coordinates, it writes 1 to the ACK register and sets the $INT_CONV_COMPLETE$ interrupt flag.

The ID should be zero in touch compatibility mode. The host should indicate no touch at all by writing (0x8000; 0x8000) with ID 0.

In extended mode, the multiple touches may be sent in any order. Any IDs not assigned are assumed to be not pressed. Again, the host should indicate no touch at all by writing (0x8000; 0x8000) with ID 0.

The host can use three methods to ensure that BT817A is ready to accept touch inputs:

- 1. poll the ACK register until it is 1
- 2. use the INT_CONV_COMPLETE interrupt flag
- 3. supply touches slower than 1000 Hz, since BT817A guarantees to process the touches in under 1 ms. Note that report rates from capacitive touch panels are about 100 Hz

Like the direct capacitive driver, this touch host mode works when REG_CTOUCH_EXTENDED is both CTOUCH_MODE_EXTENDED and CTOUCH_MODE_COMPATIBILITY. CTOUCH_MODE_COMPATIBILITY should be used for the calibration procedure, just as when using native capacitive support. After changing mode, the BT817A touch engine must be reset.

4.8.6 Touch Detection in none-ACTIVE State

When the BT817A is in non-ACTIVE state, a touch event can still be detected and reported to the host through the INT_N pin. In other words, a touch event can wake-up the host if needed.

For capacitive touch, the INT_N pin will follow CTP_INT_N pin when the BT817A is in STANDBY, SLEEP or POWERDOWN state.

4.9 **Power Management**

4.9.1 Power Supply

The BT817A may be operated with a single supply of 3.3V applied to VCC and VCCIO pins, and a supply of 1.28V applied to the VCC1V2 pins. For operation with a host MPU/MCU at a lower supply,

connect the VCCIO1 to the MPU IO supply to match the interface voltage. For operation with LCD/touch panels at lower voltages, connect the VCCIO2 to the LCD/touch IO supply.

Symbol	Typical	Description
VCCI01	1.8V, or 2.5V, or 3.3V	Supply for Host interface digital I/O pins
VCCIO2	1.8V, or 2.5V, or 3.3V	Supply for RGB and touch interface I/O pins
VCCIO3	1.8V, or 2.5V, or 3.3V	Supply for NOR Flash interface I/O pins
VCCA	3.3V	Supply for AUDIO_L pin
VCC	3.3V	Supply for 3.3V circuits
VCC1V2	1.28V	Supply for digital core.

Table 4-21 Power Supply

4.9.2 Power-On-Reset(POR)

The internal circuit will generate a Power-On-Reset (POR) pulse when the supply voltage rises above the POR threshold. The POR will reset all the core digital circuits.

4.9.3 Power Modes

After the initial power up, the BT817A will stay in the SLEEP state. When needed, the host can set the BT817A to the ACTIVE state by performing a SPI ACTIVE command. The graphics engine, the audio engine and the touch engine are only functional in the ACTIVE state. To save power the host can send a command to put the BT817A into any of the low power modes: STANDBY, SLEEP and POWERDOWN. In addition, the host is allowed to put the BT817A in POWERDOWN mode from ACTIVE mode by driving the PD_N pin to low. Refer to Figure 4-9 for the power state transitions.

Figure 4-9 Power State Transition

4.9.3.1 ACTIVE state

In ACTIVE state, the BT817A is in normal operation. The clock oscillator and PLL are functioning. The system clock applied to the BT817A core engines is enabled.

4.9.3.2 STANDBY state

In STANDBY state, the clock oscillator and PLL remain functioning; the system clock applied to the BT817A core engines is disabled. All register contents are retained.

4.9.3.3 SLEEP state

In SLEEP state, the clock oscillator, PLL and system clock applied to the BT817A core engines are disabled. All register contents are retained.

4.9.3.4 **POWERDOWN** state

In POWERDOWN state, the clock oscillator, the PLL and the system clock applied to the BT817A core is disabled. The core engines are powered down while the SPI interface for host commands remains functional. All register contents are lost and reset to default when the chip is next switched on.

4.9.3.5 Wake up to ACTIVE from other power states

When in the POWERDOWN state, if the device enters this state via an SPI command, then only the SPI ACTIVE command will bring the device back to the ACTIVE state, provided PD_N pin is also high. However, if PD_N is used instead, then making PD_N high followed by a SPI ACTIVE command will wake up the device. Upon exiting this state, the device will perform a global reset, and will go through the same power up sequence. All settings from SPI commands will be reset except those that pertain to pin states during power down. The clock enable sequence mentioned in section 4.2.3 shall be executed to carefully select and enable the system clock.

From the SLEEP state, the host MPU sends an SPI ACTIVE command to wake the BT817A into the ACTIVE state. The host needs to wait for at least 20ms before accessing any registers or commands. This is to guarantee the clock oscillator and PLL are up and stable.

From the STANDBY state, the host MPU sends SPI ACTIVE command to wake the BT817A into the ACTIVE state. The host can immediately access any register or command.

4.9.4 Reset and Boot-up Sequence

There are a few hardware and software reset events which can be triggered to reset the BT817A. Hardware reset events:

- Power-on-Reset(POR)
- A low pulse of 5ms on PD_N pin (applicable when chip is in ACTIVE or STANDBY state)

Software reset events:

• SPI command RST_PULSE

After reset, the BT817A will be in the SLEEP state. Upon receiving the SPI ACTIVE command, the clock oscillator and PLL will start up. Once the clock is stable, the chip will check and repair its internal RAM, running the configuration and then entering into normal operations. The boot-up may take up to 300ms to complete. During boot up process, software should not access BT817A register or RAM except reading REG_ID and REG_CPURESET.

4.9.5 Pin Status at Different Power States

The BT817A pin status depends on the power state of the chip. See the following table for more details. At the power transition from ACTIVE to STANDBY or ACTIVE to SLEEP, all pins retain their previous status. The software needs to set AUDIO_L, BACKLIGHT to a known state before issuing power transition commands.

The pin status in the power down state can be changed by SPI command PIN_PD_STATE.

Pin Name	Default Drive Strength Degree	Reset	Normal	Power Down (Default)
AUDIO_L	DSD4	Out, Float	Out	Retain
SCK	-	In	In	In
MISO	DSD1	Out, Float (CS_N = 1)	IO	Out, Float
MOSI	DSD1	In	IO	In
CS_N	-	In	In	In
IO2 GPIO0	DSD1	In In	IO IO	Float Float
IO3 GPIO1	DSD1	In In	IO IO	Float Float
GPIO2	DSD1	In	IO	Float
INT_N	DSD1	OD, Float	OD / Out	Float
PD_N	-	In	In	In

PCLK	DSD1	Low	Out	Pull Low
R/G/B	DSD1	Low	Out	Pull Low

Table 4-22 Pin Status

5 Memory Map

All memory and registers in the BT817A core are memory mapped in 22-bit address space with a 2-bit SPI command prefix. Prefix 0'b00 for read and 0'b10 for write to the address space, 0'b01 is reserved for Host Commands and 0'b11 undefined. The following are the memory space definition.

Start	End	Size	NAME	Description
Address	Address			
00 0000h	0F FFFFh	1024 kB	RAM_G	General purpose graphics RAM
20 0000h	2F FFFFh	640 kB	ROM	ROM codes, font table and bitmap
30 0000h	30 1FFFh	8 kB	RAM_DL	Display List RAM
30 2000h	30 2FFFh	4 kB	RAM_REG	Registers
30 8000h	30 8FFFh	4 kB	RAM_CMD	Command buffer
30 9800h	30 98FFh	128 B	RAM_ERR_REPORT	Coprocessor fault report RAM
30 B000h	30 B7FFh	2 kB	RAM_JTBOOT	Touch control codes
80 0000h	107F FFFFh	256 MB	FLASH	External NOR flash memory. Maximum
				256MB. The address is used by internal
				command only.

Table 5-1 BT817A Memory Map

Note 1: The addresses beyond this table are reserved and shall not be read or written unless otherwise specified.

5.1 Registers

Table5-2showsthecompletelistoftheBT817Aregisters.RefertoBT81XSeriesProgrammingGuide,Chapter 3 for details of the register function.

Address	Register Name	Bit	r/	Reset	Description
(hex)		s	w	value	
302000 h	REG_ID	8	r/o	7Ch	Identification register, always reads as 7Ch
302004h	REG_FRAMES	32	r/o	0	Frame counter, since reset
302008h	REG_CLOCK	32	r/o	0	Clock cycles, since reset
30200Ch	REG_FREQUENCY	28	r/w	48000000	Main clock frequency (Hz). Firmware sets to 60000000 at boot.
302010h	REG_RENDERMODE	1	r/w	0	Rendering mode: 0 = normal, 1 = single-line
302014h	REG_SNAPY	11	r/w	0	Scanline select for RENDERMODE 1
302018h	REG_SNAPSHOT	1	r/w	-	Trigger for RENDERMODE 1
30201Ch	REG_SNAPFORMAT	6	r/w	20h	Pixel format for scanline readout
302020h	REG_CPURESET	3	r/w	2	Graphics, audio, and touch engines reset control. Bit2: audio, bit1: touch, bit0: graphics
302024h	REG_TAP_CRC	32	r/o	-	Live video tap crc. Frame CRC is computed every DL SWAP.
302028h	REG_TAP_MASK	32	r/w	FFFFFFFh	Live video tap mask
30202Ch	REG_HCYCLE	12	r/w	224h	Horizontal total cycle count
302030h	REG_HOFFSET	12	r/w	02Bh	Horizontal display start offset
302034h	REG_HSIZE	12	r/w	1E0h	Horizontal display pixel count
302038h	REG_HSYNC0	12	r/w	000h	Horizontal sync fall offset
30203Ch	REG_HSYNC1	12	r/w	029h	Horizontal sync rise offset
302040h	REG_VCYCLE	12	r/w	124h	Vertical total cycle count
302044h	REG_VOFFSET	12	r/w	00Ch	Vertical display start offset
302048h	REG_VSIZE	12	r/w	110h	Vertical display line count
30204Ch	REG_VSYNC0	10	r/w	000h	Vertical sync fall offset
302050h	REG_VSYNC1	10	r/w	00Ah	Vertical sync rise offset

Address	Register Name	Bit	r/	Reset	Description
(hex)		S	w	value	
302054h	REG_DLSWAP	2	r/w	0	Display list swap control
302058h	REG_ROTATE	3	r/w	0	Screen rotation control. Allow
					normal/mirrored/inverted for
20205Ch	REG_OUTBITS	9	m/114	0	landscape or portrait orientation. Output bit resolution, 3 register
30205Ch	REG_OUTBITS	9	r/w	0	bits each for R/G/B data pins. 0
					indicates 8 bits, 1-7 indicates 1-7
					bits, respectively.
302060h	REG_DITHER	1	r/w	1	Output dither enable
302064h	REG_SWIZZLE	4	r/w	0	Output RGB signal swizzle
302068h	REG CSPREAD	1	r/w	1	Output clock spreading enable
30206Ch	REG_PCLK_POL	1	r/w	0	PCLK polarity:
					0: RGB output changes on PCLK
					falling edge,
					1: RGB output changes on PCLK
					rising edge
302070h	REG_PCLK	8	r/w	0	PCLK frequency divider
					0: disable
					1: EXTSYNC mode
			,		2-255: divider from system clock
302074h	REG_TAG_X	11		0	Tag query X coordinate
302078h	REG_TAG_Y	11	r/w	0	Tag query Y coordinate
30207Ch	REG_TAG	8	r/o	0	Tag query result
302080h	REG_VOL_PB	8	r/w	FFh	Volume for playback
302084h 302088h	REG_VOL_SOUND REG_SOUND	8 16	r/w r/w	FFh 0	Volume for synthesizer sound Sound effect select
3020880h	REG_SOUND REG_PLAY	10	r/w	0 0h	Start effect playback
30208Ch	REG_GPIO_DIR	8	r/w	80h	Legacy GPIO pin direction,
50209011		0	1/ 1	0011	0 = input , 1 = output
302094h	REG GPIO	8	r/w	00h	Legacy GPIO read/write
302098h	REG_GPIOX_DIR	16	r/w	8000h	Extended GPIO pin direction,
			.,		0 = input, 1 = output
30209Ch	REG_GPIOX	16	r/w	0080h	Extended GPIO read/write
3020A0h	Reserved	-	-	-	Reserved
-					
3020A4h					
3020A8h	REG_INT_FLAGS	9	,	000h	Interrupt flags, clear by read
3020Ach	REG_INT_EN	1	r/w	0	Global interrupt enable,
2020501		-	,		1=enable
3020B0h	REG_INT_MASK	9	r/w	1FFh	Individual interrupt enable,
					1=enable. Firmware sets to ffh at
3020B4h	REG_PLAYBACK_START	20	r/w	0	boot. Audio playback RAM start
50200411	REG_FEATBACK_START	20	1/ 1	0	address
3020B8h	REG_PLAYBACK_LENGTH	20	r/w	0	Audio playback sample length
5020200		20	.,	Ū	(bytes)

Table 5-2 Overview of BT817A Registers

Note: All register addresses are 4-byte aligned. The value in the "Bits" column refers to the number of valid bits from bit 0 unless otherwise specified; other bits are reserved.

5.2 Chip ID

The BT817A Chip ID can be read at memory location C0000h – C0003h. The reset values of these bytes are:

- C0000h: 81h
- C0001h: 7Ah
- C0002h: 01h
- C0003h: 00h

Note that the Chip ID memory location is part of RAM_G, which can be over-written by the user software. A reset event defined in section 4.9.4 will bring back the Chip ID information in these memory locations.

6 Devices Characteristics and Ratings

6.1 Absolute Maximum Ratings

The absolute maximum ratings for the BT817A devices are as follows. These are in accordance with the Absolute Maximum Rating System (IEC 60134). Exceeding these may cause permanent damage to the device.

Parameter	Value	Unit
Storage Temperature	-65 to +150	°C
Floor Life (Out of Bag) At Factory Ambient	168 (IPC/JEDEC J-STD-033A MSL Level	Hours
(30°C / 60% Relative Humidity)	3 Compliant)*	
Ambient Temperature (Power Applied)	-40 to +105	°C
VCC Supply Voltage	0 to +4	V
VCCIO Supply Voltage	0 to +4	V
DC Input Voltage	-0.5 to + 5.5	V

Table 6-1 Absolute Maximum Ratings

* If the devices are stored out of the packaging, beyond this time limit, the devices should be baked before use. The devices should be ramped up to a temperature of $+125^{\circ}$ C and baked for up to 17 hours.

6.2 ESD and Latch-up Specifications

Description	Specification
Human Body Mode (HBM)	> ± 2kV
Charge Device mode (CDM)	> ± 500V
Latch-up	<u>> ± 200mA</u>

 Table 6-2 ESD and Latch-Up Specifications

6.3 DC Characteristics

Typical condition refers to: VCC=3.3V, VCCIO=3.3V, VCC1V2=1.28V, Ta=25 °C, unless otherwise stated

Parameter	Description	Minimum	Typical	Maximum	Units	Conditions
VCCI01/	VCCIO operating	1.62	1.8	1.98	V	Normal Operation
VCCIO2/	supply voltage	2.25	2.5	2.75	V	
VCCIO3		3.0	3.3	3.6	V	
VCC/ VCCA	VCC operating supply voltage	3.0	3.3	3.6	V	Normal Operation
VCC1V2	core operating supply voltage	1.24	1.28	1.32	V	Normal Operation
Icc1	Core power Down current	-	0.2	-	mA	Power down mode
Icc2	Core sleep current	-	0.6	-	mA	Sleep Mode
Icc3	Core standby current	-	3.6	-	mA	Standby Mode
Icc4	Core operating current	-	30	-	mA	Normal Operation

Table 6-3 Operating Voltage and Current

Pin Group	drive strength	1.8V	2.5V	3.3V	Unit
Pin group A: R[7:0], G[7:0], B[7:0], PCLK, HSYNC, VSYNC, DE, DISP, BACKLIGHT, CTP_RST_N, CTP_INT_N, CTP_SCL, CTP_SDA	DSD1	1.2	2	2.5	mA
	DSD2	2.4	4	5	mA
	DSD3	3.6	6	7.5	mA
	DSD4	4.8	8	10	mA

Document No.: BRT_000251 Clearance No.: BRT#194

Pin group B: MOSI, MISO, GPIO0/IO2, GPIO1/IO3, INT_N, GPIO2, GPIO3, AUDIO_L, SPIM_SCK, SPIM_MOSI, SPIM_MISO, SPIM_CS_N, SPIM_IO2, SPIM_IO3	DSD1	2.4	3.8	5	mA
	DSD2	4.8	7.6	10	mA
	DSD3	7.2	11.4	15	mA
	DSD4	9.6	15.2	20	mA

Table 6-4 Digital Output Pin Drive Strength

Parameter	Description	Minimum	Typical	Maximum	Units	Conditions
Voh	Output Voltage High	VCCIO-0.5	-	-	V	Ioh: refer to Table 6-4

8 Package Parameters

The BT817A is available in VQFN-64 package. The package dimensions, markings and solder reflow profile for all packages are described in following sections.

8.1 Part Markings

8.1.1 Top Side

Notes:

1. YYWW = Date Code, where YY is year and WW is week number

8.1.2 Bottom Side

No markings should be placed on the bottom side.

8.2 VQFN-64 Package Dimensions

All dimensions are in millimetres (mm). Tolerance aaa/bbb/ccc/ddd/eee: 0.1.

8.3 Solder Reflow Profile

The recommended solder reflow profile for the package is shown in Figure 8-2.

The recommended values for the solder reflow profile are detailed in Figure 8-2. Values are shown for both a completely Pb free solder process (i.e., the BT817A is used with Pb free solder), and for a non-Pb free solder process (i.e., the BT817A is used with non-Pb free solder).

Profile Feature	Pb Free Solder Process	Non-Pb Free Solder Process
Average Ramp Up Rate (T_s to T_p)	3°C / second Max.	3°C / Second Max.
Preheat - Temperature Min (T _s Min.) - Temperature Max (T _s Max.) - Time (t _s Min to t _s Max)	150°C 200°C 60 to 120 seconds	100°C 150°C 60 to 120 seconds
Time Maintained Above Critical Temperature T _L : - Temperature (T _L) - Time (t _L)	217°C 60 to 150 seconds	183°C 60 to 150 seconds
Peak Temperature (T _p)	260°C	240°C
Time within 5°C of actual Peak Temperature (t₀)	20 to 40 seconds	20 to 40 seconds
Ramp Down Rate	6°C / second Max.	6°C / second Max.
Time for T= 25°C to Peak Temperature, T_p	8 minutes Max.	6 minutes Max.

Table 8-1 Reflow Profile Parameter Values
