

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100mA LDO

General Description

DA9233 is an ultra-low quiescent current high efficiency buck regulator and an ultra-low quiescent current LDO in a compact I²C configurable WLCSP package. The Buck regulator also features ultra-low output ripple (<10mV). It is targeting battery powered applications needing low ripple and highly efficient power supplies.

The buck regulator extends high light load efficiency down to 20µA further extending battery life. Dynamic Voltage Control in the Buck regulator facilitates optimization across the system power modes enabling further improvement in System efficiency and battery life.

The low quiescent current LDO can be configured as a Load Switch and provides the second supply output. The LDO's uncommitted inputs can be connected to either the battery or the buck output. Connecting the input to the buck output provides the flexibility to improve the PSRR at the LDO output as needed.

DA9233 provides multiple protection features and comes with the ability to monitor the events and indicators in the GPO pin.

Suitable for space constrained applications, the DA9233 comes in a 1.65 mm x 1.25 mm x 0.5 mm, 12-pin WLCSP package.

Key Features

- 60mA buck regulator
 - 750nA total input current (buck enabled, no load)
 - Up to 80% efficiency at 1.8V output, 20µA load currents
 - Input voltage 2.5V to 5.5V (Minimum 2.75V for start-up)
 - Output voltage 0.6V to 1.9V
 - Dynamic Voltage Control (DVC)
- 100mA LDO / Load Switch
 - Ultra-low quiescent current
 - Input voltage 1.8 V to 5.5 V
 - Output voltage 0.7 V to 3.3 V
- I²C interface for device configuration and control
- Protection features and System Monitors
- Small 1.65mm x 1.25mm x 0.5mm, 12-pin WLCSP package

Applications

- Wearables – wrist wear, hearables
- Smart devices - thermostats and door locks
- Smoke detectors
- Portable medical devices
- Remote sensors
- High efficiency, low power applications

4 Absolute Maximum Ratings

Table 3: Absolute Maximum Ratings

Symbol	Description	Conditions	Min	Max	Unit
T _{STG}	Storage temperature		-65	150	°C
T _J	Operating junction temperature		-40	125	°C
VDD	Analog V _{IN} pin	Tied to VDD_SYS	-0.3	6	V
VDD_SYS	Power V _{IN} pin	Tied to VDD	-0.3	6	V
I/O pins	Maximum voltage	I/O pin voltage ≤ VDD	-0.3	6	V

Stresses beyond those listed under Absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, so functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

5 Recommended Operating Conditions

Table 4: Recommended Operating Conditions

Parameter	Description	Conditions	Min	Typ	Max	Unit
VDD	Analog V_{IN}	Tied to VDD_SYS	2.5 Note 1		5.5	V
VDD_SYS	Power V_{IN}	Tied to VDD	2.5 Note 1		5.5	V
I _{OUT_BUCK}	Load Current	Output current from SW pin, continuous DC current			60	mA
VDD_LDO	Input voltage range for LDO mode	$VDD_LDO \leq VDD$	1.8		5.5	V
	Input voltage range for Load switch mode	$VDD_LDO \leq VDD$	0.8		5.5	V

Note 1 Requires minimum 2.75V for start-up. Once started, input voltage can go down to 2.5V.

6 ESD Ratings

Parameter	Description	Conditions	Value	Unit
V _{ESD}	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 Note 1	± 2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 Note 2	± 500	

Note 1 JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

Note 2 JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7 Electrical Characteristics

VDD = VDD_SYS = 3.6 V, T_A = -40°C to 85°C. Typical values are at T_A = 25°C (unless otherwise noted).

Figure 178: LDO $V_{IN} = 3.7\text{ V}$, LDO $I_{LOAD} = 100\text{ mA}$

10 Feature Descriptions

10.1 Chip Enable and Disable Through IC_EN

DA9233 features a dedicated IC_EN pin to enable and disable the chip. When IC_EN = high, the device is turned on. IC_EN voltage should not exceed VDD_SYS voltage on the device. When EN = low, the device is shut down completely, including I²C communications.

10.2 VDD Under-Voltage Lockout

DA9233 features an under-voltage lockout (UVLO) on VDD. When VDD falls below UVLO falling threshold, both buck and LDO are disabled, see Section 10.4.9 for fault behaviour and control, A VIN_UV_Event will be flagged if it is not masked. When VDD rises above the UVLO rising threshold, the device will be alive. VDD should be always tied to VDD_SYS on the PCB board so both VDD and VDD_SYS will share the same UVLO protection.

10.3 Over-Temperature Protection

DA9233 also features an on-Chip over-temperature protection (TSD). The die junction temperature is monitored when LDO is ON. When the junction temperature is higher than the thermal shutdown threshold, both buck and LDO are disabled to prevent the device being damaged by over-heating, see Section 10.4.9 for fault behavior and control. An OT_Event will be flagged if it is not masked.

10.4 Buck Regulator

DA9233 includes a nano-ampere standby buck regulator with an adjustable output voltage, Dynamic Voltage Scaling capability and a maximum load current of 60 mA. It also has power saving mode operation and different protection features.

10.4.1 Buck Output Voltage Programmability

The DA9233 buck regulator can be set to two different ranges based on the value of VOUT_RANGE_HI. The value of BUCK_VOUT<4:0> is locked to a certain range based on the value of VOUT_RANGE_HI, and VOUT_RANGE_HI can only be changed while the buck is disabled. The buck can be set to the output voltages shown in Table 11. If a command is received outside of the allowable range (that is above 1.3 V for VOUT_RANGE_HI = 0 or below 1.3 V for VOUT_RANGE_HI = 1), digital will force the value of BUCK_VOUT<3:0> to 01110 (1.3 V).

Table 11: Buck Output Voltage Settings

VOUT_RANGE_HI	BUCK_VOUT<4:0>	Buck Output Voltage (V)
0	00000	0.60
0	00001	0.65
0	00010	0.70

1	11111	1.90

10.4.2 Start-up Operation

DA9233 buck integrates a start-up circuit to minimize output voltage over-shoot and input voltage drop during start-up. When writing 1 to BUCK_EN (Bit 7 of Reg0x05), the buck is enabled and starts switching after a typical delay time of 3 ms. During start-up, the cycle-by-cycle current limit is reduced to limit inrush current.

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100mA LDO

NDA Confidential

10.4.3 Power Saving Mode Operation

DA9233 buck regulator features power saving mode that greatly reduces the quiescent current when device has very light load condition. Buck regulator operates in discontinuous mode with Pulse Frequency Modulation (PFM). The low-side FET will be turned off based on a zero-crossing comparator to prevent negative inductor current flowing through the FET which can result in additional conduction loss. If both FETs remain in the OFF state for a certain delay time after inductor current crosses zero, the device will enter power saving mode. In power saving mode, DA9233 shuts down most of the internal circuitry to save current consumption. The lighter the load, the longer the duration of power saving mode will be, to achieve the lowest quiescent current and improve light load efficiency.

10.4.4 Dynamic Voltage Control

DA9233 buck regulator has dynamic voltage control (DVC) feature which allows the buck output voltage to track the internal reference voltage when it changes at a rate of 50 mV/2 ms. Since the buck output voltage can only be changed within an allowable range while still keeping the buck enabled, DVC also follows the same behaviour. The DVC is done via I²C, whereby the buck output voltage setting is stepped in 50 mV steps within either the low range or high range. Each voltage step lasts for 2 ms.

10.4.5 Cycle-by-cycle Over-Current Protection

For the Over-current Protection (OCP) in DA9233, the peak current through high-side FET is monitored cycle-by-cycle. When the sensed current exceeds the pre-set current limit, the high-side FET will be turned OFF immediately to limit the inductor current. The high-side FET will be turned on again after the constant-off time expires. If the OC condition persists for 64 μ s, buck will be forced off and buck output will be pull-down until the fault clears, see Section 10.4.9 for fault behavior and control and Section 10.4.8 for output voltage discharge and control. An OC_BUCK_Event will be flagged if it is not masked.

10.4.6 Output Over-Voltage Protection

DA9233 features an output over-voltage protection (OVP) to protect the load from damage. When both IC_EN and BUCK_EN are high and the buck output voltage is 200 mV greater than the internal reference voltage, the high side FET is immediately OFF, see Section 10.4.9 for fault behavior and control. Then the internal buck output discharge FET will be turned on to discharge buck output capacitor, see Section 10.4.8 for output voltage discharge and control. An OV_BUCK_Event will be flagged if it is not masked. Buck will remain off and buck output will be pull-down until the fault is cleared.

10.4.7 Output Under-Voltage Protection

When buck output short happens, inductor current will increase until the peak reaches the cycle-by-cycle current limit. Then the high-side FET turns OFF and low-side FET turns on. Since buck output is shorted, inductor current slope is very small during low-side FET on time. The inductor current could gradually go higher and higher. To effectively prevent the inductor current running away at V_{OUT} short condition, buck V_{OUT} is also monitored. If over-current condition happens and buck V_{OUT} drops 400 mV below the reference voltage, the buck regulator will be shut off immediately and an UV_BUCK_Event will be flagged if it is not masked, see Section 10.4.9 for fault behavior and control.

10.4.8 Automatic Output voltage Discharge

To speed up the discharging of buck output capacitor and ensure a safer start-up next time, the buck regulator provides automatic output voltage discharge when IC_EN is pulled low or buck shutdown caused by any fault. Automatic output discharge when buck is forced OFF by fault needs to set register bit BUCK_PD_CFG1 = 0; automatic output discharge when buck is disabled by BUCK_EN = 0 needs to set register bit BUCK_PD_CFG2 = 0. The output of the buck regulator is discharged through VBUCK_SNS pin and an internal buck output discharge FET with typical 33 Ω resistance.

10.4.9 Event Flag and Fault Control

DA9233 has the flexibility for customers to control the behavior of buck/LDO when there is a fault condition. There are five register bits (UVLO_FRC_DIS, TSD_FRC_DIS, OV_DIS_BUCK, OC_BUCK_EVENT, SC_DIS_BUCK) controlling whether the buck/LDO will be disabled when the corresponding fault condition happens. In addition, users can choose whether to mask or unmask the event flag when the fault condition happens.

When there is a VDD Under-voltage condition, both BUCK and LDO will be forced OFF if UVLO_FRC_DIS = 1. Buck and LDO will remain alive if UVLO_FRC_DIS = 0. During the VDD Under-voltage condition, the event register bit VIN_UV_EVENT = 1 if the corresponding mask register bit M_VIN_UV is set to 0 otherwise VIN_UV_EVENT = 0.

When there is an Over-Temperature fault inside the device, both buck and LDO will be forced OFF if TSD_FRC_DIS = 1. If TSD_FRC_DIS = 0, buck and LDO will remain alive. During the over-temperature condition, the event register bit OT_EVENT = 1.

When there is an over-voltage fault at buck output, buck will be forced OFF if OV_DIS_BUCK = 1. Buck will continue switching if OV_DIS_BUCK = 0. During the fault, OV_BUCK_EVENT is set to 1 if M_OV_BUCK_EVENT = 0 otherwise OV_BUCK_EVENT = 0.

When the over-current condition in buck persists for 64 μ s and M_OC_BUCK_EVENT is set to 0, OC_BUCK_EVENT will be set to 1. If OC_DIS_BUCK = 1, BUCK is forced disabled. If OC_DIS_BUCK = 0, buck will continue switching during the over-current condition.

When there is a buck Output under-voltage condition and M_UV_BUCK_EVENT = 0, UV_BUCK_EVENT is set to 1. If both buck output under-voltage and over-current condition exist and SC_DIS_BUCK = 1, buck will be forced OFF. If SC_DIS_BUCK = 0, buck will continue switching without shutting down by the under-voltage protection.

DA9233 also has a fault recovery mechanism that can be customized through the 3-bits RCVRY_NUM. This value determines the fault recovery trial number for buck and is counted down by every fault that triggers buck OFF. When RCVRY_NUM reaches 0, recovery trial is ended and buck will remain OFF even if the buck enable signals are toggled HI. If RCVRY_NUM is set to 0x7, there will be no count down on the recovery trial number and recovery trail will not be ended. Before RCVRY_NUM reaches 0, buck will be recovered automatically if the fault condition disappears.

Event flags are not automatically cleared when the fault conditions disappear. They have to be cleared by changing the values in register EVENT through I²C.

10.5 Load Switch, LDO Output and Control

10.5.1 LDO Output Programmability

The LDO can be set to the output voltages shown in [Table 12](#). The LDO output voltage can only be changed while LDO is disabled.

Table 12: LDO Output Voltages Settings

LDO_VOUT<4:0>	LDO Output Voltage (V)
00000	0.7
00001	0.8
00010	0.9
00011	1.0
00100	1.1
00101	1.2
00110	1.3
00111	1.4
01000	1.5
01001	1.6
01010	1.7
01011	1.8
01100	1.9
01101	2.0

01111	2.2
10000	2.3
10001	2.4
10010	2.5
10011	2.6
10100	2.7
10101	2.8
10110	2.9
10111	3.0
11000	3.1
11001	3.2
11010	3.3

LDO_VOUT<4:0>	LDO Output Voltage (V)
11011	Load switch mode
11100	Load switch mode
11101	Load switch mode
11110	Load switch mode
11111	Load switch mode

10.5.2 Automatic Output Voltage Discharge

Similar to buck regulator, the LDO also provides automatic output voltage discharge when IC_EN is pulled low or LDO turn-off caused by any fault. The internal LDO output discharge FET has a typical 25 Ω resistance.

10.5.3 Load Switch

DA9233 also features load switch mode for its LDO. When LDO_VOUT<4:0> is set to any value between 11011 and 11111, the LDO is configured as a load switch. In load switch mode, the LDO FET is fully ON. The turn-on and turn-off of load switch is controlled only through I²C command.

See Section [10.4.9](#) for fault behaviour and control, and Section [10.4.8](#) for output voltage discharge and control.

10.6 I²C Programming

10.6.1 Interface Description

DA9233 includes an I²C compatible interface based on the following signals:

- SCL: standard 400 kHz I²C bus serial clock generated by the Host processor
- SDA: standard 400 kHz I²C bus serial address/data input output

SDA and SCL are open drain I/O terminals. The standard frequency of the I²C bus is 400 kHz in fast mode or 100 kHz in slow mode.

Figure 189: I²C Serial Interface Pins

The I²C bus is used to control most functions and change register values depending on the application requirements. In active battery, the I²C circuitry is powered from the battery. The interface maintains a proper operation as long as VDD_SYS is valid.

The device is compatible with the standard I²C protocol but only operates as a slave. The transfer protocol is the same whether operating in fast or slow mode.

10.6.2 Details of the I²C Protocol

The device supports 7-bit addressing only, the address is 0x2F. The 8-bit shifted address is 0x5E. A timer runs during I²C transitions. If the timer expires while SDA is held low, all additional commands are ignored and the I²C state machine is reset. The timer is reset with a START condition and stopped with a STOP condition.

The I²C bus is monitored at all times for a valid SLAVE address, and an acknowledge bit is generated if the SLAVE address was true.

- A START condition is initiated by a high to low transition on the SDA line while the SCL is in the high state.
- A STOP condition is indicated by a low to high transition on the SDA line while the SCL is in the high state.
- An ACKNOWLEDGE is indicated by the receiver pulling the SDA line low during the following clock cycle.

Figure 20: I²C Start and Stop Conditions

When the address is matching the following event sequence happens:

1. The device generates an ACKNOWLEDGE to indicate to the master that the communication link has been established
2. The master generates SCL clock cycles to transmit or receive data
3. After receiving data, an ACKNOWLEDGE is generated either by the device or the master (whichever is transmitting the data)
A data sequence is 9-bit, consisting of 8-bit data and 1-bit ACKNOWLEDGE. It can be repeated as long as necessary.
4. The master generates a STOP condition to end the data transfer

The bus returns to IDLE-mode if during a message a new START or STOP condition occurs. Data is transmitted MSB first for both R/W operations.

10.7 GPO Pin Function Programming

DA9233 has a General purpose output (GPO) pin which can be programmed to have multiple functions.

10.7.1 Power Good Indicator

When GPO pin is configured to the VDD power good indicator, it is an open drain output and can be configured to either active high or active low. When GPO status is Hi-Z, an external pull-up is required for GPO to be high.

Table 13: GPO as Power Good Indicator

GPO Configuration	$V_{IN} > V_{IN_UVLO}$	GPO Status
Active High	No	0
	Yes	Hi-Z
Active Low	No	Hi-Z
	Yes	0

10.7.2 Event Indicator

GPO pin can also be configured as the event indicator in open drain output. Whenever there is an event or multiple events (VIN_UV_EVNT or OV_BUCK_EVENT or OC_BUCK_EVENT or UV_BUCK_EVENT) happen, GPO will be pulled down Low. This can be used as an interrupt to host CPU to inform events happened. When there is no event, GPO will remain in Hi-Z status and an external pull-up is required for GPO to be high.

10.7.3 Reset Pulse Generation

GPO pin can be configured to generate a reset pulse signal when buck starts. The reset signal can be used by host CPU or other device that are connected to buck output. When GPO is Low, it indicates a reset pulse period; when GPO is in Hi-Z status (An external pull-up is required for GPO to be high), it indicates a non-reset period.

There is also a timing control to negate the reset pulse signal. The GPO reset pulse width can be adjusted between 8 and 112 ms measured from written 1 to BUCK_EN register bit.

10.7.4 Always Pull-Down or Hi-Z

When GPO pin is not used, it can be configured to either always Hi-Z or pull-down to Low.

Table 24: Register PIN_MONTOR

Address	Register Name	POR Value	PIN MONITOR
0x000A	PIN_MONTOR	0x00	

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100mA LDO

NDA Confidential

7	6	5	4	3	2	1	0
Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	GPO_OUT_MON
Field Name	Bits	Type	POR	Description			
GPO_OUT_MON	[0]	virtual	0x0	Indicate current GPO output			

11.2.2 System Module

11.2.2.1 System Reset Registers

Table 25: Register SYS_RST_EVENT

Address	Register Name	POR Value	Reset Event flag				
0x0001	SYS_RST_EVENT	0x01					
7	6	5	4	3	2	1	0
Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	RESET_EVENT
Field Name	Bits	Type	POR	Description			
RESET_EVENT	[0]	evnt	0x1	RESET event flag. After Reset, this bit is set. When I2C write '1' to this bit, this event flag is cleared.			

Table 26: Register SYS_SRST

Address	Register Name	POR Value	Soft Reset				
0x0009	SYS_SRST	0x00					
7	6	5	4	3	2	1	0
Reserved	Reserved	Reserved	Reserved	SRST<3:0>			

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100mA LDO

Field Name	Bits	Type	POR	Description
SRST	[3:0]	cfg	0x0	Initiate Soft Reset by writing 0x5.

11.2.2.2 System ID Registers

Table 27: Register SYS_DEVICE_ID

Address	Register Name	POR Value	DEVICE_ID				
0x0080	SYS_DEVICE_ID	0x00					
7	6	5	4	3	2	1	0
DEV_ID<7:0>							
Field Name	Bits	Type	POR	Description			
DEV_ID	[7:0]	virtual	0x0	Device ID; hard-coded or metal-programmed			

Table 28: Register SYS_VARIANT_ID

Address	Register Name	POR Value	VARIANT_ID				
0x0081	SYS_VARIANT_ID	0x00					
7	6	5	4	3	2	1	0
MRC<3:0>				VRC<3:0>			
Field Name	Bits	Type	POR	Description			
MRC	[7:4]	virtual	0x0	Mask Revision Code; mask design changes increment reset value.			

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100mA LDO

NDA Confidential

VRC	[3:0]	trim OTP	0x0	Chip Variant Code; e.g. package variants.
-----	-------	-------------	-----	---

Table 29: Register SYS_CONFIG_ID

Address	Register Name	POR Value	CONFIG_ID				
0x0082	SYS_CONFIG_ID	0x00					
7	6	5	4	3	2	1	0
CONFIG_REV<7:0>							
Field Name	Bits	Type	POR	Description			
CONFIG_REV	[7:0]	trim OTP	0x0	OTP settings revision			

12 Package Information

12.1 Package Outlines

Figure 191: Package Outline Drawing

12.2 Moisture Sensitivity Level

The Moisture Sensitivity Level (MSL) is an indicator for the maximum allowable time period (floor lifetime) in which a moisture sensitive plastic device, once removed from the dry bag, can be exposed to an environment with a maximum temperature of 30 °C and a maximum relative humidity of 60% RH before the solder reflow process. The MSL classification is defined in [Table 30](#).

The device package is qualified for MSL 1.

Table 30: MSL Classification

MSL level	Floor Lifetime
MSL 1	unlimited at 30 °C/85% RH

12.3 Soldering Information

Refer to the JEDEC standard J-STD-020 for relevant soldering information. This document can be downloaded from <http://www.jedec.org>.

13 Ordering Information

The ordering number consists of the part number followed by a suffix indicating the packing method. For details and availability or other custom OTP parts, please consult Dialog Semiconductor's [customer portal](#) or your local sales representative.

Table 31: Ordering Information

Part number	Package	Size (mm)	Shipment Form	Pack Quantity
DA9233-xxxx	WLCSP-12	1.25 x 1.65	T&R	4500

Table 32: OTP List

Order number	Description	Buck V _{OUT} (V)	LDO V _{OUT} (V)
DA9233-A1VZ2	OTP with Buck and LDO voltage preconfigured	0.7	1.8

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100mA LDO

NDA Confidential

Status Definitions

Revision	Datasheet Status	Product Status	Definition
1.<n>	Target	Development	This datasheet contains the design specifications for product development. Specifications may be changed in any manner without notice.
2.<n>	Preliminary	Qualification	This datasheet contains the specifications and preliminary characterization data for products in pre-production. Specifications may be changed at any time without notice in order to improve the design.
3.<n>	Final	Production	This datasheet contains the final specifications for products in volume production. The specifications may be changed at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via Customer Product Notifications.
4.<n>	Obsolete	Archived	This datasheet contains the specifications for discontinued products. The information is provided for reference only.

Disclaimer

Information in this document is believed to be accurate and reliable. However, Dialog Semiconductor does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information. Dialog Semiconductor furthermore takes no responsibility whatsoever for the content in this document if provided by any information source outside of Dialog Semiconductor.

Dialog Semiconductor reserves the right to change without notice the information published in this document, including without limitation the specification and the design of the related semiconductor products, software and applications.

Applications, software, and semiconductor products described in this document are for illustrative purposes only. Dialog Semiconductor makes no representation or warranty that such applications, software and semiconductor products will be suitable for the specified use without further testing or modification. Unless otherwise agreed in writing, such testing or modification is the sole responsibility of the customer and Dialog Semiconductor excludes all liability in this respect.

Customer notes that nothing in this document may be construed as a license for customer to use the Dialog Semiconductor products, software and applications referred to in this document. Such license must be separately sought by customer with Dialog Semiconductor.

All use of Dialog Semiconductor products, software and applications referred to in this document are subject to Dialog Semiconductor's [Standard Terms and Conditions of Sale](#), unless otherwise stated.

RoHS Compliance

Dialog Semiconductor complies to European Directive 2001/95/EC and from 2 January 2013 onwards to European Directive 2011/65/EU concerning Restriction of Hazardous Substances (RoHS/RoHS2).

Dialog Semiconductor's statement on RoHS can be found on the customer portal <https://support.diasemi.com/>. RoHS certificates from our suppliers are available on request.
