## Surface Mount **Digital Step Attenuator**

**DAT-31R5A+ Series** 

50Ω 0 to 31.5 dB, 0.5 dB Step DC to 4.0 GHz

### **The Big Deal**

- Wideband, operates up to 4 GHz
- Immune to latchup
- High IP3, 52 dBm

#### CASE STYLE: DG983-2

### **Product Overview**

The DAT-31R5A+ series of 50Ω digital step attenuators provides adjustable attenuation from 0 to 31.5 dB in 0.5 dB steps. The control is a 6-bit serial/parallel interface, and the attenuators operate with either a single positive or dual (positive and negative) supply voltage. DAT-31R5A+ series models are produced by a unique CMOS process on silicon, offering the performance of GaAs with the advantages of conventional CMOS devices.

Feature	Advantages
Wideband operation, specified from DC to 4.0 GHz	Can be used in multiple applications such as communications, satellite and defense, reducing part count.
Serial or parallel interface	Models available with serial or parallel interface mode to suit customer demand.
Good VSWR, 1.2:1 typ.	Eases interfacing with adjacent components and results in low amplitude ripple.
Single positive supply models: (Model suffixes: -SP+ and -PP+) +2.3 to +3.6V+	Use of single positive supply simplifies power supply design. An internal negative voltage generator supplies the desired negative voltage. Single positive supply results in excellent spurious performance, -140 dBm typical.
Dual supply models: (Model suffixes: -SN+ and -PN+) +2.7 to +3.6V (Positive) and -3.6 to -3.2V (Negative)	Dual supply provides spurious-free operation. It also allows fast switching up to 1 MHz (vs. 25 kHz for single supply).
Useable over a wide range of supply voltages, +2.3/2.7 to 5.2V	Wide range fo positive operating voltages allows the DAT-31R5A+ Series of models to be used in a wide range of applications. See Application Note AN-70-006 for operation above +3.6V
Footprint compatible to DAT-31R5-XX+ Series (XX=SN/SP/PN/PP)	Can fit into existing footprint and provide wideband performance, to 4 GHz instead of 2.4 GHz.
Safe attenuation transitions	The DAT-31R5A-XX+ series is designed to prevent any momentary positive 'spikes' in power during attenuation transitions

- Power amplifier distortion canceling loops

#### **General Description**

The DAT-31R5A-PN+ is a 50 $\Omega$  RF digital step attenuator that offers an attenuation range of 31.5 dB in 0.5 dB steps. The control is a 6-bit parallel interface, operating on dual supply voltage (positive & negative). The DAT-31R5A-PN+ is produced using a unique CMOS process on silicon, offering the performance of GaAs, with the advantages of conventional CMOS devices.

### Pin Configuration (Top View)

**Device Marking** 

Notes:

1. Both RF ports must be held at 0VDC or DC blocked with an external series capacitor.

2. Latch Enable (LE) has an internal 2M $\Omega$  to internal positive supply voltage.

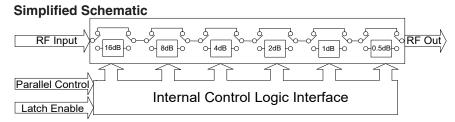

3. Place a 10K $\!\Omega$  resistor in series, as close to pin as possible to avoid freq. resonance.

4. Place a shunt 10K $\Omega$  resistor to GND

5. The exposed solder pad on the bottom of the package (See Pin configuration) must be grounded for proper device operation.

6. This pin has an internal 200  $k\Omega$  resistor to ground.

### DAT-31R5A-PN+

The DAT-31R5A-PN+ parallel interface consists of 6 control bits that select the desired attenuation state, as shown in Table 1: Truth Table

Table 1. Truth Table						
Attenuation State	C16	C8	C4	C2	C1	C0.5
Reference	0	0	0	0	0	0
0.5 (dB)	0	0	0	0	0	1
1 (dB)	0	0	0	0	1	0
2 (dB)	0	0	0	1	0	0
4 (dB)	0	0	1	0	0	0
8 (dB)	0	1	0	0	0	0
16 (dB)	1	0	0	0	0	0
31.5 (dB)	1	1	1	1	1	1
Note: Not all 64 possible combinations of C0.5 - C16 are shown in table						

The parallel interface timing requirements are defined by Figure 2 (Parallel Interface Timing Diagram) and Table 2 (Parallel Interface AC Characteristics), and switching speed.

For latched parallel programming the Latch Enable (LE) should be held LOW while changing attenuation state control values, then pulse LE HIGH to LOW (per Figure 2) to latch new attenuation state into device.

For direct parallel programming, the Latch Enable (LE) line should be pulled HIGH. Changing attenuation state control values will change device state to new attenuation. Direct mode is ideal for manual control of the device (using hardwire, switches, or jumpers).

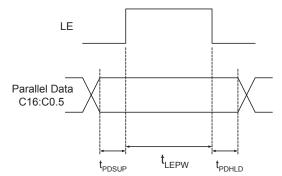

Table 2. Parallel Interface AC Characteristics						
Symbol	Parameter	Min.	Max.	Units		
t <sub>LEPW</sub>	LE minimum pulse width	10		ns		
t <sub>PDSUP</sub>	Data set-up time before clock rising edge of LE	10		ns		
t <sub>PDHLD</sub>	Data hold time after clock falling edge of LE	10		ns		

#### **Power-up Control Settings**

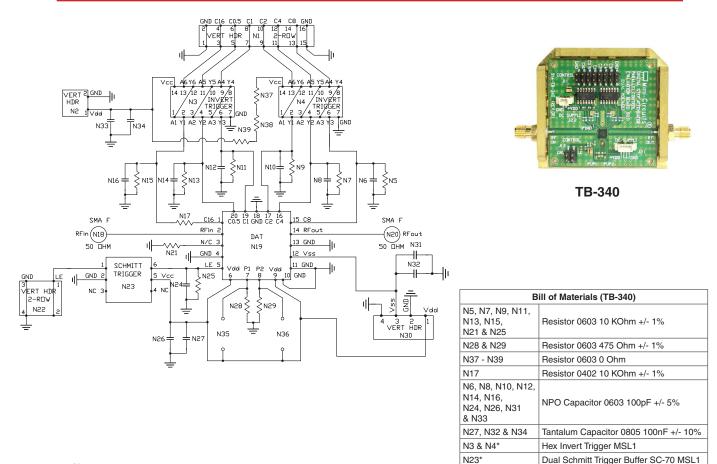

The DAT-31R5A-PN+ always assumes a specifiable attenuation setting on power-up, allowing a known attenuation state to be established before an initial parallel control word is provided.

When the attenuator powers up with LE=0, the control bits are automatically set to one of four possible values .These four values are selected by the two power-up control bits,PUP1 and PUP2 ,as shown in Table 3: (Power-Up Truth Table, Parallel Mode).

Table 3. Power-Up Truth Table, Parallel Mode						
Attenuation State	PUP1	PUP2	LE			
Reference	0	0	0			
8 (dB)	0	1	0			
16 (dB)	1	0	0			
31.5 (dB)	1	1	0			
Defined by C0.5-C16 (See Table 1-Truth Table) X (Note 1) X (Note 1) 1						
Note 1: PUP1 and PUP2 Connection may be 0, 1, GROUND, or not connect, without effect on attenuation state.						

Power-Up with LE=1 provides normal parallel operation with C0.5-C16, and PUP1 and PUP2 are not active.
