

LTM4601 5V_{IN} to 20V_{IN}, 12A Step-Down μModule Regulator

DESCRIPTION

Demonstration circuit DC1041A-A features the LTM[®]4601EV, a 12A high efficiency, high density switch mode step-down converter. The input voltage range is from 4.5V to 20V. The output voltage is jumper selectable for popular voltages from 0.6V to 5V. The PLLIN pin supports synchronizing the μModule[®] regulator to an external clock. The TRACK/SS pin allows the user to program output ramp-up and ramp-down rates which may coincidentally or ratiometrically track with another supply's output if desired. Output voltage margining of

±5% from the nominal value is available via the margin control pins MARG0 and MARG1. The LTM4601 data sheet must be read in conjunction with this demo manual prior to working on or modifying demo circuit DC1041A-A.

Design files for this circuit board are available at <http://www.linear.com/demo>

PERFORMANCE SUMMARY (T_A = 25°C)

PARAMETER	CONDITION	VALUE
Input Voltage Range		4.5V to 20V
Output Voltage V _{OUT}	Jumper Selectable (Open for 0.6V)	1.2V, 1.5V, 1.8V, 2.5V, 3.3V, 5V
Maximum Continuous Output Current	Derating is Necessary for Certain V _{IN} , V _{OUT} and Thermal Conditions	12A DC
Default Operating Frequency		850kHz
External Synchronous Clock Frequency Range	Refer to Data Sheet for Details	600kHz to 1000kHz
Efficiency	V _{IN} = 12V, V _{OUT} = 1.5V, I _{OUT} = 12A	83%, See Figure 2

DEMO MANUAL DC1041A-A

QUICK START PROCEDURE

Demonstration circuit DC1041A-A is an easy way to evaluate the performance of the LTM4601EV. Please refer to Figure 1 for proper measurement equipment setup and follow the procedure below:

1. With the power supply off, connect the input power supply, load and meters as shown in Figure 1. Preset the load to 0A and power supply voltage within the LTM4601's operating input voltage range.

2. Place jumpers in the following positions for a typical 1.5V_{OUT} application:

MARG0	MARG1	RUN	V _{OUT} SELECT
LO	LO	ON	1.5V

3. Turn on the power at the input. The output voltage should be 1.5V ± 1%.

4. Once the proper output voltage is established, adjust the load within the operating range and observe the output voltage regulation, ripple voltage, efficiency and other parameters. Output ripple should be measured at J4 with a BNC cable.

5. For optional load transient test, apply an adjustable pulse signal between IOSTEP (E3) and GND pins. Pulse amplitude sets the current step. The pulse signal should have very small duty cycle (<15%) to limit the thermal stress on the transient load circuit. The output transient current can be monitored at BNC connector J3 (10mV/A).

6. For Margining function test, place jumper MARG0 and MARG1 in the configurations shown in the following table, measure the output voltage at J4.

MARG1	MARG0	ΔV _{OUT}
LO	LO	0
LO	HI	+5%
HI	LO	-5%
HI	HI	0
