

FEATURES

- Programmable Differential Gain via Two External Resistors
- Adjustable Output Common Mode Voltage
- Operates and Specified with 3V, 5V, ±5V Supplies
- 0.5dB Ripple 4th Order Lowpass Filter with 5MHz Cutoff
- 82dB S/N with 3V Supply and 2V_{P-P} Output
- Low Distortion, 2V_{P-P}, 800Ω Load
1MHz: 93dBc 2nd, 96dBc 3rd
- Fully Differential Inputs and Outputs
- Compatible with Popular Differential Amplifier Pinouts
- Available in an SO-8 Package

APPLICATIONS

- High Speed ADC Anti-Aliasing and DAC Smoothing in Networking or Cellular Base Station Applications
- High Speed Test and Measurement Equipment
- Medical Imaging
- Drop-in Replacement for Differential Amplifiers

DESCRIPTION

The LT[®]6600-5 combines a fully differential amplifier with a 4th order 5MHz lowpass filter approximating a Chebyshev frequency response. Most differential amplifiers require many precision external components to tailor gain and bandwidth. In contrast, with the LT6600-5, two external resistors program differential gain, and the filter's 5MHz cutoff frequency and passband ripple are internally set. The LT6600-5 also provides the necessary level shifting to set its output common mode voltage to accommodate the reference voltage requirements of A/Ds.

Using a proprietary internal architecture, the LT6600-5 integrates an anti-aliasing filter and a differential amplifier/driver without compromising distortion or low noise performance. At unity gain the measured in band signal-to-noise ratio is an impressive 82dB. At higher gains the input referred noise decreases so the part can process smaller input differential signals without significantly degrading the output signal-to-noise ratio.

The LT6600-5 also features low voltage operation. The differential design provides outstanding performance for a 2V_{P-P} signal level while the part operates with a single 3V supply.

For similar devices with other cutoff frequencies, refer to the LT6600-20, LT6600-10 and LT6600-2.5.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: This is the temperature coefficient of the internal feedback resistors assuming a temperature independent external resistor (R_{IN}).

Note 3: The input common mode voltage is the average of the voltages applied to the external resistors (R_{IN}). Specification guaranteed for $R_{IN} \geq 229\Omega$.

Note 4: Distortion is measured differentially using a differential stimulus. The input common mode voltage, the voltage at Pin 2, and the voltage at Pin 7 are equal to one half of the total power supply voltage.

Note 5: Output common mode voltage is the average of the voltages at Pins 4 and 5. The output common mode voltage is equal to the voltage applied to Pin 2.

Note 6: The LT6600C is guaranteed functional over the operating temperature range -40°C to 85°C .

Note 7: The LT6600C is guaranteed to meet 0°C to 70°C specifications and is designed, characterized and expected to meet the extended temperature limits, but is not tested at -40°C and 85°C . The LT6600I is guaranteed to meet specified performance from -40°C to 85°C .

Note 8: The inputs are protected by back-to-back diodes. If the differential input voltage exceeds 1.4V, the input current should be limited to less than 10mA.

TYPICAL PERFORMANCE CHARACTERISTICS

PIN FUNCTIONS

IN⁻ and IN⁺ (Pins 1, 8): Input Pins. Signals can be applied to either or both input pins through identical external resistors, R_{IN} . The DC gain from differential inputs to the differential outputs is $806\Omega/R_{IN}$.

V_{OCM} (Pin 2): Is the DC Common Mode Reference Voltage for the 2nd Filter Stage. Its value programs the common mode voltage of the differential output of the filter. Pin 2 is a high impedance input, which can be driven from an external voltage reference, or Pin 2 can be tied to Pin 7 on the PC board. Pin 2 should be bypassed with a 0.01 μ F ceramic capacitor unless it is connected to a ground plane.

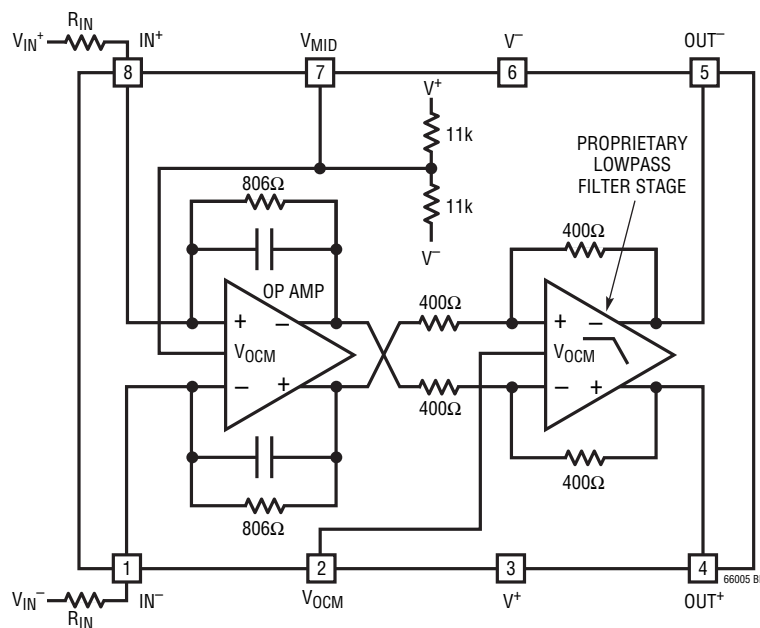

V⁺ and V⁻ (Pins 3, 6): Power Supply Pins. For a single 3.3V or 5V supply (Pin 6 grounded) a quality 0.1 μ F ceramic bypass capacitor is required from the positive supply pin (Pin 3) to the negative supply pin (Pin 6). The bypass should be as close as possible to the IC. For dual supply

applications, bypass Pin 3 to ground and Pin 6 to ground with a quality 0.1 μ F ceramic capacitor.

OUT⁺ and OUT⁻ (Pins 4, 5): Output Pins. Pins 4 and 5 are the filter differential outputs. Each pin can drive a 100 Ω and/or 50pF load to AC ground.

V_{MID} (Pin 7): The V_{MID} pin is internally biased at mid-supply, see block diagram. For single supply operation the V_{MID} pin should be bypassed with a quality 0.01 μ F ceramic capacitor to Pin 6. For dual supply operation, Pin 7 can be bypassed or connected to a high quality DC ground. A ground plane should be used. A poor ground will increase noise and distortion. Pin 7 sets the output common mode voltage of the 1st stage of the filter. It has a 5.5k Ω impedance, and it can be overridden with an external low impedance voltage source.

BLOCK DIAGRAM

APPLICATIONS INFORMATION

Interfacing to the LT6600-5

The LT6600-5 requires 2 equal external resistors, R_{IN} , to set the differential gain to $806\Omega/R_{IN}$. The inputs to the filter are the voltages V_{IN}^+ and V_{IN}^- presented to these external components, Figure 1. The difference between V_{IN}^+ and V_{IN}^- is the differential input voltage. The average of V_{IN}^+ and V_{IN}^- is the common mode input voltage. Similarly, the voltages V_{OUT}^+ and V_{OUT}^- appearing at Pins 4 and 5 of the LT6600-5 are the filter outputs. The difference between V_{OUT}^+ and V_{OUT}^- is the differential output voltage. The average of V_{OUT}^+ and V_{OUT}^- is the common mode output voltage.

Figure 1 illustrates the LT6600-5 operating with a single 3.3V supply and unity passband gain; the input signal is DC coupled. The common mode input voltage is 0.5V and the differential input voltage is $2V_{P-P}$. The common mode output voltage is 1.65V and the differential output voltage

is $2V_{P-P}$ for frequencies below 5MHz. The common mode output voltage is determined by the voltage at Pin 2. Since Pin 2 is shorted to Pin 7, the output common mode is the mid-supply voltage. In addition, the common mode input voltage can be equal to the mid-supply voltage of Pin 7 (refer to the Distortion vs Input Common Mode Level graphs in the Typical Performance Characteristics).

Figure 2 shows how to AC couple signals into the LT6600-5. In this instance, the input is a single-ended signal. AC coupling allows the processing of single-ended or differential signals with arbitrary common mode levels. The 0.1μF coupling capacitor and the 806Ω gain setting resistor form a high pass filter, attenuating signals below 2kHz. Larger values of coupling capacitors will proportionally reduce this highpass 3dB frequency.

In Figure 3 the LT6600-5 is providing 12dB of gain. The gain resistor has an optional 62pF in parallel to improve

Figure 1

Figure 2

Figure 3

APPLICATIONS INFORMATION

the passband flatness near 5MHz. The common mode output voltage is set to 2V.

Use Figure 4 to determine the interface between the LT6600-5 and a current output DAC. The gain, or “transimpedance,” is defined as $A = V_{OUT}/I_{IN} \Omega$. To compute the transimpedance, use the following equation:

$$A = \frac{806 \cdot R1}{R1 + R2} \Omega$$

By setting $R1 + R2 = 806\Omega$, the gain equation reduces to $A = R1\Omega$.

The voltage at the pins of the DAC is determined by $R1$, $R2$, the voltage on Pin 7 and the DAC output current (I_{IN}^+ or I_{IN}^-). Consider Figure 4 with $R1 = 49.9\Omega$ and $R2 = 750\Omega$. The voltage at Pin 7 is 1.65V. The voltage at the DAC pins is given by:

$$V_{DAC} = V_{PIN7} \cdot \frac{R1}{R1 + R2 + 806} + I_{IN} \frac{R1 \cdot R2}{R1 + R2}$$

$$= 51mV + I_{IN} 46.8\Omega$$

I_{IN} is I_{IN}^- or I_{IN}^+ . The transimpedance in this example is 50.3Ω .

Figure 4

Evaluating the LT6600-5

The low impedance levels and high frequency operation of the LT6600-5 require some attention to the matching networks between the LT6600-5 and other devices. The previous examples assume an ideal (0Ω) source impedance and a large ($1k\Omega$) load resistance. Among practical examples where impedance must be considered is the evaluation of the LT6600-5 with a network analyzer.

Figure 5 is a laboratory setup that can be used to characterize the LT6600-5 using single-ended instruments with 50Ω source impedance and 50Ω input impedance. For a unity gain configuration the LT6600-5 requires a 806Ω source resistance yet the network analyzer output is calibrated for a 50Ω load resistance. The 1:1 transformer, 51.1Ω and 787Ω resistors satisfy the two constraints above. The transformer converts the single-ended source into a differential stimulus. Similarly, the output the LT6600-5 will have lower distortion with larger load resistance yet the analyzer input is typically 50Ω . The 4:1 turns ($16:1$ impedance) transformer and the two 402Ω resistors of Figure 5, present the output of the LT6600-5 with a 1600Ω differential load, or the equivalent of 800Ω to ground at each output. The impedance seen by the network analyzer input is still 50Ω , reducing reflections in the cabling between the transformer and analyzer input.

Figure 5

Differential and Common Mode Voltage Ranges

The differential amplifiers inside the LT6600-5 contain circuitry to limit the maximum peak-to-peak differential voltage through the filter. This limiting function prevents excessive power dissipation in the internal circuitry and provides output short-circuit protection. The limiting function begins to take effect at output signal levels above $2V_{P-P}$ and it becomes noticeable above $3.5V_{P-P}$. This is illustrated in Figure 6; the LTC6600-5 was configured with unity passband gain and the input of the filter was driven with a 1MHz signal. Because this voltage limiting takes place well before the output stage of the filter reaches the supply rails, the input/output behavior of the IC shown in Figure 6 is relatively independent of the power supply voltage.

APPLICATIONS INFORMATION

Figure 6

The two amplifiers inside the LT6600-5 have independent control of their output common mode voltage (see the Block Diagram section). The following guidelines will optimize the performance of the filter for single supply operation.

Pin 7 must be bypassed to an AC ground with a 0.01 μ F or higher capacitor. Pin 7 can be driven from a low impedance source, provided it remains at least 1.5V above V^- and at least 1.5V below V^+ . An internal resistor divider sets the voltage of Pin 7. While the internal 11k resistors are well matched, their absolute value can vary by $\pm 20\%$. This should be taken into consideration when connecting an external resistor network to alter the voltage of Pin 7.

Pin 2 can be shorted to Pin 7 for simplicity. If a different common mode output voltage is required, connect Pin 2 to a voltage source or resistor network. For 3V and 3.3V supplies the voltage at Pin 2 must be less than or equal to the mid-supply level. For example, voltage (Pin 2) $\leq 1.65V$ on a single 3.3V supply. For power supply voltages higher than 3.3V the voltage at Pin 2 can be set above mid-supply. The voltage on Pin 2 should not be more than 1V below the voltage on Pin 7. The voltage on Pin 2 should not be more than 2V above the voltage on Pin 7. Pin 2 is a high impedance input.

The LT6600-5 was designed to process a variety of input signals including signals centered around the mid-supply voltage and signals that swing between ground and a positive voltage in a single supply system (Figure 1). The range of allowable input common mode voltage (the average of V_{IN}^+ and V_{IN}^- in Figure 1) is determined by

the power supply level and gain setting (see the Electrical Characteristics section).

Common Mode DC Currents

In applications like Figure 1 and Figure 3 where the LT6600-5 not only provides lowpass filtering but also level shifts the common mode voltage of the input signal, DC currents will be generated through the DC path between input and output terminals. Minimize these currents to decrease power dissipation and distortion.

Consider the application in Figure 3. Pin 7 sets the output common mode voltage of the 1st differential amplifier inside the LT6600-5 (see the Block Diagram section) at 2.5V. Since the input common mode voltage is near 0V, there will be approximately a total of 2.5V drop across the series combination of the internal 806 Ω feedback resistor and the external 200 Ω input resistor. The resulting 2.5mA common mode DC current in each input path, must be absorbed by the sources V_{IN}^+ and V_{IN}^- . Pin 2 sets the common mode output voltage of the 2nd differential amplifier inside the LT6600-5, and therefore sets the common mode output voltage of the filter. Since in the example, Figure 3, Pin 2 differs from Pin 7 by 0.5V, an additional 1.25mA (0.625mA per side) of DC current will flow in the resistors coupling the 1st differential amplifier output stage to filter output. Thus, a total of 6.25mA is used to translate the common mode voltages.

A simple modification to Figure 3 will reduce the DC common mode currents by 36%. If Pin 7 is shorted to Pin 2, the common mode output voltage of both op amp stages will be 2V and the resulting DC current will be 4mA. Of course, by AC coupling the inputs of Figure 3 and shorting Pin 7 to Pin 2, the common mode DC current is eliminated.

Noise

The noise performance of the LT6600-5 can be evaluated with the circuit of Figure 7.

Given the low noise output of the LT6600-5 and the 6dB attenuation of the transformer coupling network, it will be necessary to measure the noise floor of the spectrum analyzer and subtract the instrument noise from the filter noise measurement.

APPLICATIONS INFORMATION

Figure 7

Example: With the IC removed and the 25Ω resistors grounded, measure the total integrated noise (e_S) of the spectrum analyzer from 10kHz to 5MHz. With the IC inserted, the signal source (V_{IN}) disconnected, and the input resistors grounded, measure the total integrated noise out of the filter (e_O). With the signal source connected, set the frequency to 1MHz and adjust the amplitude until V_{IN} measures 100mV_{P-P}. Measure the output amplitude, V_{OUT} , and compute the passband gain $A = V_{OUT}/V_{IN}$. Now compute the input referred integrated noise (e_{IN}) as:

$$e_{IN} = \frac{\sqrt{(e_O)^2 - (e_S)^2}}{A}$$

Table 1 lists the typical input referred integrated noise for various values of R_{IN} .

Figure 8 is plot of the noise spectral density as a function of frequency for an LT6600-5 with $R_{IN} = 806\Omega$ and 200Ω using the fixture of Figure 7 (the instrument noise has been subtracted from the results).

Table 1. Noise Performance

PASSBAND GAIN (V/V)	R_{IN}	INPUT REFERRED INTEGRATED NOISE 10kHz TO 10MHz	INPUT REFERRED NOISE dBm/Hz
4	200Ω	24μV _{RMS}	-149
2	402Ω	38μV _{RMS}	-145
1	806Ω	69μV _{RMS}	-140

The noise at each output is comprised of a differential component and a common mode component. Using a transformer or combiner to convert the differential outputs to single-ended signal rejects the common mode noise and gives a true measure of the S/N achievable in the system.

Figure 8

Conversely, if each output is measured individually and the noise power added together, the resulting calculated noise level will be higher than the true differential noise.

Power Dissipation

The LT6600-5 amplifiers combine high speed with large-signal currents in a small package. There is a need to ensure that the die's junction temperature does not exceed 150°C. The LT6600-5 package has Pin 6 fused to the lead frame to enhance thermal conduction when connecting to a ground plane or a large metal trace. Metal trace and plated through-holes can be used to spread the heat generated by the device to the backside of the PC board. For example, on a 3/32" FR-4 board with 2oz copper, a total of 660 square millimeters connected to Pin 6 of the LT6600-5 (330 square millimeters on each side of the PC board) will result in a thermal resistance, θ_{JA} , of about 85°C/W. Without extra metal trace connected to the V^- pin to provide a heat sink, the thermal resistance will be around 105°C/W. Table 2 can be used as a guide when considering thermal resistance.

Table 2. LT6600-5 SO-8 Package Thermal Resistance

COPPER AREA		BOARD AREA (mm ²)	THERMAL RESISTANCE (JUNCTION-TO-AMBIENT)
TOPSIDE (mm ²)	BACKSIDE (mm ²)		
1100	1100	2500	65°C/W
330	330	2500	85°C/W
35	35	2500	95°C/W
35	0	2500	100°C/W
0	0	2500	105°C/W

APPLICATIONS INFORMATION

Junction temperature, T_J , is calculated from the ambient temperature, T_A , and power dissipation, P_D . The power dissipation is the product of supply voltage, V_S , and supply current, I_S . Therefore, the junction temperature is given by:

$$T_J = T_A + (P_D \cdot \theta_{JA}) = T_A + (V_S \cdot I_S \cdot \theta_{JA})$$

where the supply current, I_S , is a function of signal level, load impedance, temperature and common mode voltages.

For a given supply voltage, the worst-case power dissipation occurs when the differential input signal is maximum, the common mode currents are maximum (see Applications Information regarding common mode DC currents), the load impedance is small and the ambi-

ent temperature is maximum. To compute the junction temperature, measure the supply current under these worst-case conditions, estimate the thermal resistance from Table 2, then apply the equation for T_J . For example, using the circuit in Figure 3 with DC differential input voltage of 250mV, a differential output voltage of 1V, 1k Ω load resistance and an ambient temperature of 85°C, the supply current (current into Pin 3) measures 32.2mA. Assuming a PC board layout with a 35mm² copper trace, the θ_{JA} is 100°C/W. The resulting junction temperature is:

$$T_J = T_A + (P_D \cdot \theta_{JA}) = 85 + (5 \cdot 0.0322 \cdot 100) = 101^\circ\text{C}$$

When using higher supply voltages or when driving small impedances, more copper may be necessary to keep T_J below 150°C.

PACKAGE DESCRIPTION

S8 Package
8-Lead Plastic Small Outline (Narrow .150 Inch)
 (Reference LTC DWG # 05-08-1610)

S08 0303
