

2.2GHz Low Noise, Low Distortion Differential ADC Driver for DC-300MHz

FEATURES

- 2.2GHz –3dB Bandwidth
- Fixed Gain of 2.5V/V (8dB)
- –99dBc IMD3 at 70MHz (Equivalent OIP3 = 53.4dBm)
- –61dBc IMD3 at 300MHz (Equivalent OIP3 = 34.8dBm)
- 1nV/√Hz Internal Op Amp Noise
- 7.6dB Noise Figure
- Differential Inputs and Outputs
- 400Ω Input Impedance
- 2.85V to 3.5V Supply Voltage
- 85mA Supply Current (255mW)
- 1V to 1.6V Output Common Mode, Adjustable
- DC- or AC-Coupled Operation
- Max Differential Output Swing 4.8V_{P-P}
- Small 16-Lead 3mm × 3mm × 0.75mm QFN Package

APPLICATIONS

- Differential ADC Driver
- Differential Driver/Receiver
- Single Ended to Differential Conversion
- IF Sampling Receivers
- SAW Filter Interfacing

DESCRIPTION

The LTC®6400-8 is a high-speed differential amplifier targeted at processing signals from DC to 300MHz. The part has been specifically designed to drive 12-, 14- and 16-bit ADCs with low noise and low distortion, but can also be used as a general-purpose broadband gain block.

The LTC6400-8 is easy to use, with minimal support circuitry required. The output common mode voltage is set using an external pin, independent of the inputs, which eliminates the need for transformers or AC-coupling capacitors in many applications. The gain is internally fixed at 8dB (2.5V/V).

The LTC6400-8 saves space and power compared to alternative solutions using IF gain blocks and transformers. The LTC6400-8 is packaged in a compact 16-lead 3mm × 3mm QFN package and operates over the –40°C to 85°C temperature range.

LT, LT, LTC and LTM are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners.

LTC6400 AND LTC6401 SELECTOR GUIDE Please check each datasheet for complete details.

PART NUMBER	GAIN (dB)	GAIN (V/V)	Z_{IN} (DIFFERENTIAL) (Ω)	I_{CC} (mA)
LTC6401-8	8	2.5	400	45
LTC6401-14	14	5	200	45
LTC6401-20	20	10	200	50
LTC6401-26	26	20	50	45
LTC6400-8	8	2.5	400	85
LTC6400-14	14	5	200	85
LTC6400-20	20	10	200	90
LTC6400-26	26	20	50	85

In addition to the LTC6400 family of amplifiers, a lower power LTC6401 family is available. The LTC6401 is pin compatible to the LTC6400, and has the same low noise performance. The lower power consumption of the LTC6401 comes at the expense of slightly higher non-linearity, especially at input frequencies above 140MHz. Please refer to the separate LTC6401 data sheets for complete details.

DC ELECTRICAL CHARACTERISTICS

The ● denotes the specifications which apply over the full operating temperature range, otherwise specifications are at $T_A = 25^\circ\text{C}$. $V^+ = 3\text{V}$, $V^- = 0\text{V}$, $+IN = -IN = V_{OCM} = 1.25\text{V}$, $\overline{\text{ENABLE}} = 0\text{V}$, No R_L unless otherwise noted.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: Input pins (+IN, -IN) are protected by steering diodes to either supply. If the inputs go beyond either supply rail, the input current should be limited to less than 10mA.

Note 3: The LTC6400C and LTC6400I are guaranteed functional over the operating temperature range of -40°C to 85°C .

Note 4: The LTC6400C is guaranteed to meet specified performance from 0°C to 70°C . It is designed, characterized and expected to meet specified

performance from -40°C to 85°C but is not tested or QA sampled at these temperatures. The LTC6400I is guaranteed to meet specified performance from -40°C to 85°C .

Note 5: Input and output baluns used. See Test Circuit A.

Note 6: Measured using Test Circuit B. $R_L = 87.5\Omega$ per output.

Note 7: Since the LTC6400-8 is a feedback amplifier with low output impedance, a resistive load is not required when driving an AD converter. Therefore, typical output power is very small. In order to compare the LTC6400-8 with amplifiers that require 50Ω output load, the LTC6400-8 output voltage swing driving a given R_L is converted to OIP3 and P1dB as if it were driving a 50Ω load. Using this modified convention, $2V_{\text{P-P}}$ is by definition equal to 10dBm, regardless of actual R_L .

TYPICAL PERFORMANCE CHARACTERISTICS

PIN FUNCTIONS

V⁺ (Pins 1, 3, 10): Positive Power Supply (Normally tied to 3V or 3.3V). All three pins must be tied to the same voltage. Bypass each pin with 1000pF and 0.1μF capacitors as close to the pins as possible.

V_{OCM} (Pin 2): This pin sets the output common mode voltage. A 0.1μF external bypass capacitor is recommended.

V⁻ (Pins 4, 9, 12, 17): Negative Power Supply. All four pins must be connected to same voltage/ground.

-OUT, +OUT (Pins 5, 8): Unfiltered Outputs. These pins have series resistors, $R_{OUT} 12.5\Omega$.

-OUTF, +OUTF (Pins 6, 7): Filtered Outputs. These pins have 50Ω series resistors and a 2.7pF shunt capacitor.

ENABLE (Pin 11): This pin is a logic input referenced to V_{EE} . If low, the part is enabled. If high, the part is disabled and draws very low standby current while the internal op amp has high output impedance.

+IN (Pins 13, 14): Positive Input. Pins 13 and 14 are internally shorted together.

-IN (Pins 15, 16): Negative Input. Pins 15 and 16 are internally shorted together.

Exposed Pad (Pin 17): V^- . The Exposed Pad must be connected to same voltage/ground as pins 4, 9, 12.

BLOCK DIAGRAM

APPLICATIONS INFORMATION

Circuit Operation

The LTC6400-8 is a low noise and low distortion fully differential op amp/ADC driver with:

- Operation from DC to 2.2GHz -3 dB bandwidth
- Fixed gain of 2.5V/V (8dB)
- Differential input impedance 400 Ω
- Differential output impedance 25 Ω
- Differential impedance of output filter 100 Ω

The LTC6400-8 is composed of a fully differential amplifier with on chip feedback and output common mode voltage control circuitry. Differential gain and input impedance are set by 200 Ω /500 Ω resistors in the feedback network. Small output resistors of 12.5 Ω improve the circuit stability over various load conditions. They also provide a possible external filtering option, which is often desirable when the load is an ADC.

Filter resistors of 50 Ω are available for additional filtering. Lowpass/bandpass filters are easily implemented with just a couple of external components. Moreover, they offer single-ended 50 Ω matching in wideband applications and no external resistor is needed.

The LTC6400-8 is very flexible in terms of I/O coupling. It can be AC- or DC-coupled at the inputs, the outputs or both. Due to the internal connection between input and output, users are advised to keep input common mode voltage between 1V and 1.8V for proper operation. If the inputs are AC-coupled, the input common mode voltage is automatically biased approximately 450mV above V_{OCM} and thus no external circuitry is needed for bias. The LTC6400-8 provides an output common mode voltage set by V_{OCM} , which allows driving ADC directly without external components such as transformer or AC coupling capacitors. The input signal can be either single-ended or differential with only minor difference in distortion performance.

Input Impedance and Matching

The differential input impedance of the LTC6400-8 is 400 Ω . Usually the differential inputs need to be terminated to a lower value impedance, e.g. 50 Ω , in order to provide an impedance match for the source. Several choices are available. One approach is to use a differential shunt resistor (Figure 1). Another approach is to employ a wideband transformer and shunt resistor (Figure 2). Both methods provide a wideband match. The termination resistor or the transformer must be placed close to the input pins in

APPLICATIONS INFORMATION

Figure 1. Input Termination for Differential 50Ω Input Impedance Using Shunt Resistor

Figure 3. Input Termination for Single-Ended 50Ω Input Impedance

Figure 2. Input Termination for Differential 50Ω Input Impedance Using a Balun

order to minimize the reflection due to input mismatch. Alternatively, one could apply a narrowband impedance match at the inputs of the LTC6400-8 for frequency selection and/or noise reduction.

Referring to Figure 3, LTC6400-8 can be easily configured for single-ended input and differential output without a balun. The signal is fed to one of the inputs through a matching network while the other input is connected to the same matching network and a source resistor. Because the return ratios of the two feedback paths are equal, the two outputs have the same gain and thus symmetrical swing. In general, the single-ended input impedance and termination resistor R_T are determined by the combination of R_S , R_G and R_F . For example, when R_S is 50Ω, it is found that the single-ended input impedance is 322Ω and R_T is 59Ω in order to match to a 50Ω source impedance.

The LTC6400-8 is unconditionally stable, i.e. differential stability factor $K_f > 1$ and stability measure $B1 > 0$. However, the overall differential gain is affected by both source impedance and load impedance as shown in Figure 4:

$$A_V = \left| \frac{V_{OUT}}{V_{IN}} \right| = \frac{1000}{R_S + 400} \cdot \frac{R_L}{25 + R_L}$$

The noise performance of the LTC6400-8 also depends upon the source impedance and termination. For example, an input 1:4 transformer in Figure 2 improves SNR by adding 6dB gain at the inputs. A trade-off between gain and noise is obvious when constant noise figure circle and constant gain circle are plotted within the input Smith Chart, based on which users can choose the optimal source impedance for a given gain and noise requirement.

Figure 4. Calculate Differential Gain

APPLICATIONS INFORMATION

Output Impedance Match and Filter

The LTC6400-8 can drive an ADC directly without external output impedance matching. Alternatively, the differential output impedance of 25Ω can be made larger, e.g. 50Ω, by series resistors or LC network.

The internal low pass filter outputs at +OUTF/-OUTF have a -3dB bandwidth of 590MHz. External capacitors can reduce the lowpass filter bandwidth as shown in Figure 5. A bandpass filter is easily implemented with

Figure 5. LTC6400-8 Internal Filter Topology Modified for Low Filter Bandwidth (Three External Capacitors)

only a few components as shown in Figure 6. Three 39pF capacitors and a 16nH inductor create a bandpass filter with 165MHz center frequency, -3dB frequencies at 138MHz and 200MHz.

Figure 6. LTC6400-8 Modified 165MHz for Bandpass Filtering (Three External Capacitors, One External Inductor)

Output Common Mode Adjustment

The LTC6400-8's output common mode voltage is set by the V_{OCM} pin, which is a high impedance input. The output common mode voltage is capable of tracking V_{OCM} in a range from 1V to 1.6V. Bandwidth of V_{OCM} control is typically 14MHz, which is dominated by a low pass filter connected to the V_{OCM} pin and is aimed to reduce common mode noise generation at the outputs. The internal common mode feedback loop has a -3dB bandwidth around 400MHz, allowing fast rejection of any common mode output voltage disturbance. The V_{OCM} pin should be tied to a DC bias voltage with a 0.1μF bypass capacitor. When interfacing with 3V A/D converters such as the LT22xx families, the V_{OCM} pin can be connected to the V_{CM} pin of the ADC.

Driving A/D Converters

The LTC6400-8 has been specifically designed to interface directly with high speed A/D converters. Figure 7 shows the LTC6400-8 with single-ended input driving the LTC2208, which is a 16-bit, 130Msps ADC. Two external 5Ω resistors help eliminate potential resonance associated with bond wires of either the ADC input or the driver output. V_{OCM} of the LTC6400-8 is connected to V_{CM} of the LTC2208 at 1.25V. Alternatively, an input single-ended signal can be converted to differential signal via a balun and fed to the input of the LTC6400-8.

Figure 7. Single-Ended Input to LTC6400-8 and LTC2208

APPLICATIONS INFORMATION

Figure 8 summarizes the IMD3 performance of the whole system as shown in Figure 7.

Figure 8. IMD3 for the Combination of LTC6400-8 and LTC2208

Test Circuits

Due to the fully-differential design of the LTC6400 and its usefulness in applications with differing characteristic specifications, two test circuits are used to generate the information in this datasheet. Test Circuit A is DC987B, a two-port demonstration circuit for the LTC6400 family. The silkscreen is shown in Figure 9. This circuit includes input and output transformers (baluns) for single-ended-to-differential conversion and impedance transformation, allowing direct hook-up to a 2-port network analyzer. There are also series resistors at the output to present the LTC6400 with a 375Ω differential load, optimizing distortion performance. Due to the input and output transformers, the -3dB bandwidth is reduced from 2.2GHz to approximately 1.46GHz.

Figure 9. Top Silkscreen for DC987B. Test Circuit A

Test Circuit B uses a 4-port network analyzer to measure S-parameters and gain/phase response. This removes the effects of the wideband baluns and associated circuitry, for a true picture of the >1GHz S-parameters and AC characteristics.
