3V 10-Tap Silicon Delay Line

DS1110L

General Description

The DS1110L 10-tap delay line is a 3V version of the DS1110. It has 10 equally spaced taps providing delays from 10ns to 500ns. The DS1110L series delay lines provide a nominal accuracy of ±5% or ±2ns, whichever is greater, at 3.3V and +25°C. The DS1110L is characterized to operate from 2.7V to 3.6V. The DS1110L produces both leading- and trailing-edge delays with equal precision. The device is offered in a standard 14-pin TSSOP.

Features

- **All-Silicon Delay Line**
- **3V Version of the DS1110**
- **10 Taps Equally Spaced**
- **Delays Are Stable and Precise**
- **Leading- and Trailing-Edge Accuracy**
- **Delay Tolerance ±5% or ±2ns, Whichever Is Greater, at 3.3V and +25°C**
- **Economical**
- **Low-Profile 14-Pin TSSOP**
- **Low-Power CMOS**
- **TTL/CMOS Compatible**
- **Vapor Phase and IR Solderable**
- **Fast-Turn Prototypes**
- **Delays Specified Over Commercial and Industrial Temperature Ranges**
- **Custom Delays Available**

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

CAPACITANCE

(T_A = +25°C.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Input Capacitance	C_{IN}			5	10	pF

Note 1: All voltages are referenced to ground.
Note 2: Measured with outputs open.
Note 3: Initial tolerances are ± with respect to the nominal value at +25°C and V_{CC} = 3.3V for both leading and trailing edges.
Note 4: Temperature and voltage tolerances are with respect to the nominal delay value over stated temperature range and a 2.7V to 3.6V range.
Note 5: Intermediate delay values are available on a custom basis.
Note 6: See *Test Conditions* section.
Note 7: All tap delays tend to vary unidirectionally with temperature or voltage changes. For example, if tap 1 slows down, all other taps also slow down; tap 3 can never be faster than tap 2.
Note 8: Pulse width and period specifications may be exceeded; however, accuracy is application sensitive (decoupling, layout, etc.).
Note 9: For Tap 1 delays greater than 20ns, the tolerance is ±3ns or ±5%, whichever is greater.

Detailed Description

The DS1110L 10-tap delay line is a 3V version of the DS1110. It has 10 equally spaced taps providing delays from 10ns to 500ns. The device is offered in a standard 14-pin TSSOP. The DS1110L series delay lines provide a nominal accuracy of ±5% or ±2ns, whichever is greater, at 3.3V and +25°C. The DS1110L is characterized to operate from 2.7V to 3.6V. The DS1110L reproduces the input-logic state at the tap 10 output after a fixed delay as specified by the dash-number suffix of the part number (Table 1). The DS1110L produces both leading- and trailing-edge delays with equal precision. Each tap is capable of driving up to 10 74LS-type loads. Dallas Semiconductor can customize standard products to meet specific needs. Figure 1 is the DS1110_L logic diagram and Figure 2 shows the timing diagram for the silicon delay line.

Terminology

Period: The time elapsed between the leading edge of the first pulse and the leading edge of the following pulse.

t_{WI} (Pulse Width): The elapsed time on the pulse between the 1.5V point on the leading edge and the 1.5V point on the trailing edge, or the 1.5V point on the trailing edge and the 1.5V point on the leading edge.

t_{RISE} (Input Rise Time): The elapsed time between the 20% and the 80% point on the leading edge of the input pulse.

t_{FALL} (Input Fall Time): The elapsed time between the 80% and the 20% point on the trailing edge of the input pulse.

t_{PLH} (Time Delay Rising): The elapsed time between the 1.5V point on the leading edge of the input pulse and the 1.5V point on the leading edge of any tap output pulse.

t_{PHL} (Time Delay, Falling): The elapsed time between the 1.5V point on the trailing edge of the input pulse and the 1.5V point on the trailing edge of any tap output pulse.

Test Setup Description

Figure 3 illustrates the hardware configuration used for measuring the timing parameters on the DS1110L. A precision pulse generator under software control produces the input waveform. Time delays are measured by a time interval counter (20ps resolution) connected
