

### Extensive Selection of Fiber-optic Sensing Heads Offers Many Unique Solutions for Tough Problems

- Fiber-optic sensors detect small, fast-moving objects in space-confined installations and harsh environments
- For a custom fit in the field, most plastic filament cables can be cut to length
- For detection in hard-to-reach places, sensing heads with bendable stainless steel tubing retain complex shapes
- Coiled and ultra-flexible cables are ideal for flexing and reciprocating machinery such as robots
- Side-view sensing heads or accessories save space in right-angle detection
- Convergent beam sensing heads allow accurate positioning and background suppression even for shiny objects
- Narrow detection zone of concentric beam sensing heads helps eliminate background objects and gives consistent sensing, regardless of object direction
- Highly flexible fibers with minimum 1-mm bending radius allows cable to conform to machine contours
- Most fiber cables offer IP67 protection and temperature ratings of  $-40^{\circ}\text{C}$  to  $70^{\circ}\text{C}$  ( $-40^{\circ}\text{F}$  to  $158^{\circ}\text{F}$ )

## Ordering Information

Omron offers fiber-optic cables in through-beam, diffuse and retroreflective types. Each cable has a different sensing distance depending on the amplifier selected. The ordering information provides the sensing distance and compatibility with two general classes of amplifiers: DIN rail-mounting DC amplifiers and block style amplifiers with different attributes, such as AC/DC supply

voltage, analog output and color sensing.

 indicates models that customers can cut to length for their application. Models without this mark are pre-cut by the factory to maintain their respective specifications.

## ■ SENSING HEAD

### Mounting Sensing Head in a Panel

Prepare a hole in the panel that can accommodate the threaded cylindrical sensing head. Be sure to place the washer in front of the mounting nut before inserting the sensing head through the hole. Tighten the front mounting nut using no more than the maximum torque recommended in the table.

### Mounting Sensing Head in a Channel

Insert the sensing head at the desired location in the channel as shown in the illustration, then use a set screw to fasten the head in place. Apply no more than 2.6 in-lb of force in tightening the set screw.

### Tightening Torque

Use a proper-sized wrench and do not exceed the torque recommended for the sensing head.

Sensing heads	Maximum torque
M3 and M4 threads	6.88 in-lb
M6 threads	8.66 in-lb
2 mm dia., no thread	2.6 in-lb
3 mm dia., no thread	2.6 in-lb
E32-D14L	8.66 in-lb
E32-T12F	6.88 in-lb
E32-D12F	6.88 in-lb

## ■ CUTTING FIBER

Insert a fiber into the Fiber and determine the length of the fiber to be cut.

Press down the Fiber Cutter in a single stroke to cut the fiber.

When the fiber is cut, an insertion mark is inscribed on the fiber.

For a 2.2-mm dia. standard fiber only.

Insert a fiber into the Fiber Cutter in the direction indicated by the arrow (refer to the following figure).

The cutting holes cannot be used twice. If the same hole is used twice, the cutting face of the fiber will be rough and the sensing distance will be reduced. Always use an unused hole.

Use either one of the two holes on the right (refer to the following figure) to cut a thin fiber as follows:

1. An attachment is temporarily fitted to a thin fiber before shipment.

2. Secure the attachment after adjusting the position of it in the direction indicated by the arrow.
3. Insert the fiber into the E39-F4 to cut.

Note: Insert the fiber in the direction indicated by the arrow.

## ■ BENDING RADIUS

### E39-F11 Sleeve Bender

The bending radius of the stainless probe should be as large as possible. The smaller the bending radius becomes, the shorter the sensing distance will be.

Insert the tip of the stainless probe to the Sleeve Bender and bend the stainless probe slowly along the curve of the Sleeve Bender (refer to the figure).

## ■ INSTALLING FIBER CABLES

### Bends in Fiber cables

Plastic and glass filament fiber cables may be bent to avoid obstacles on the way to the sensing site. Here are some guidelines about the location of cable bends: The first bend must be at least 20 mm (0.79 in) away from where the cables enter the amplifier. The last bend must be at least 20 mm (0.79 in) bending the sensing head. We recommend a 25 mm (1.0 in) minimum radius for a right angle bend to maintain the rated sensing distance. The sharpest allowable right angle bend is over a 10 mm (0.39 in) radius, but this will result in a shorter sensing distance. Refer to the bending radius graph.

Do not apply excess force on the Fiber Units.

Do not pull or press the Fiber Units. The Fiber Units have a withstand force of 1 kg or 3 kg (pay utmost attention because the fibers are thin).

Do not bend the Fiber Units beyond the permissible bending radius.

Do not bend the edge of the Fiber Units.

### Proper Supports for Cables

To support the fiber cable between the sensing site and the amplifier, mount the cable using a nylon strap or cable tie. Do not use a U-shaped strap that will compress or put stress on the fiber cable. To prevent damage from excessive vibration, take up the fiber in a loop as shown below.

The Fiber Head could be broken by excessive vibration. To prevent this, the following is effective:

## ■ LONGER FIBER-OPTIC CABLES

### Applicable Models

- E32-TC200/-DC200
- E32-TC200B/-DC200B
- E32-TC200E/-DC200E
- E32-TC200F/-DC200F
- E32-TC200A

### Appearance

The length can be ordered in increments of 1 m between 6 m min. and 20 m max. (2-m and 5-m fiber length types are standard for E32-TC200, E32-DC200.)

### E39-F10 Fiber Connector

Use the following procedure (refer to the figure) to connect fibers via the Fiber Connector.

Each fiber should be as close as possible before they are connected.

Sensing distance will be reduced by approximately 25% when fibers are connected.

Only fibers with 2.2 mm dia. can be connected.
