

# EFM32 Giant Gecko Series 1 Family

## EFM32GG12 Family Data Sheet

The EFM32 Giant Gecko Series 1 MCUs are the world's most energy-friendly microcontrollers, featuring new connectivity interfaces and user interface features.

EFM32GG12 includes a powerful 32-bit ARM® Cortex®-M4 and provides robust security via a unique cryptographic hardware engine supporting AES, ECC, SHA, and True Random Number Generator (TRNG). New features include an SD/MMC/SDIO controller, Octal/Quad-SPI memory controller, CAN bus controller, PDM interface, highly robust capacitive sensing, enhanced alpha blending graphics engine, and LESENSE/PCNT enhancements for smart energy meters. These features, combined with ultra-low current active mode and short wake-up time from energy-saving modes, make EFM32GG12 microcontrollers well suited for any battery-powered application, as well as other systems requiring high performance and low-energy consumption.

Example applications:

- Smart energy meters
- Industrial and factory automation
- Home automation and security
- Mid- and high-tier wearables
- IoT devices

- ARM Cortex-M4 at 72 MHz
- Ultra low energy operation
  - 76  $\mu$ A/MHz in Energy Mode 0 (EM0)
  - 1.8  $\mu$ A EM2 Deep Sleep current (RTCC running with state and RAM retention)
- Octal/Quad-SPI memory interface w/ XIP
- SD/MMC/SDIO Host Controller
- PDM Microphone/Sensor Interface
- Dual CAN 2.0 Bus Controller
- Crystal-free low-energy USB
- Hardware cryptographic engine supports AES, ECC, SHA, and TRNG
- Robust capacitive touch sense
- Footprint compatible with select EFM32 packages
- 5 V tolerant I/O

Lowest power mode with peripheral operational:

- EM0 - Active
- EM1 - Sleep
- EM2 - Deep Sleep
- EM3 - Stop
- EM4H - Hibernate
- EM4S - Shutoff

## 1. Feature List

The EFM32GG12 highlighted features are listed below.

- **ARM Cortex-M4 CPU Platform**
  - High performance 32-bit processor @ up to 72 MHz
  - DSP instruction support and Floating Point Unit
  - Memory Protection Unit
  - Wake-up Interrupt Controller
- **Flexible Energy Management System**
  - 76  $\mu$ A/MHz in Active Mode (EM0)
  - 1.8  $\mu$ A EM2 Deep Sleep current (16 kB RAM retention and RTCC running from LFRCO)
- **Integrated DC-DC Buck Converter**
- **Up to 1024 kB Flash Program Memory**
  - Dual-bank with read-while-write support
- **192 kB RAM Data Memory**
  - Includes ECC (SEC-DED)
- **Octal/Quad-SPI Flash Memory Interface**
  - Supports 3 V and 1.8 V memories
  - 1/2/4/8-bit data bus
  - Quad-SPI Execute In Place (XIP)
- **Communication Interfaces**
  - Low-energy Universal Serial Bus (USB) with Device and Host support
    - Fully USB 2.0 compliant
    - On-chip PHY and embedded 5 V to 3.3 V regulator
    - Crystal-free Device mode operation
    - Patent-pending Low-Energy Mode (LEM)
  - SD/MMC/SDIO Host Controller
    - SD v3.01, SDIO v3.0 and MMC v4.51
    - 1/4/8-bit bus width
  - Up to 2 $\times$  CAN Bus Controller
    - Version 2.0A and 2.0B up to 1 Mbps
  - 5 $\times$  Universal Synchronous/Asynchronous Receiver/Transmitter
    - UART/SPI/SmartCard (ISO 7816)/IrDA/I2S/LIN
    - Triple buffered full/half-duplex operation with flow control
    - Ultra high speed (36 MHz) operation on one instance
  - 2 $\times$  Universal Asynchronous Receiver/Transmitter
  - 2 $\times$  Low Energy UART
    - Autonomous operation with DMA in Deep Sleep Mode
  - 2 $\times$  I<sup>2</sup>C Interface with SMBus support
    - Address recognition in EM3 Stop Mode
- **Up to 95 General Purpose I/O Pins**
  - Configurable push-pull, open-drain, pull-up/down, input filter, drive strength
  - Configurable peripheral I/O locations
  - 5 V tolerance on select pins
  - Asynchronous external interrupts
  - Output state retention and wake-up from Shutoff Mode
- **Up to 12 Channel DMA Controller**
- **Up to 16 Channel Peripheral Reflex System (PRS) for autonomous inter-peripheral signaling**
- **External Bus Interface for up to 4x256 MB of external memory mapped space**
  - TFT Controller with Direct Drive
  - Per-pixel alpha-blending engine
- **Hardware Cryptography**
  - AES 128/256-bit keys
  - ECC B/K163, B/K233, P192, P224, P256
  - SHA-1 and SHA-2 (SHA-224 and SHA-256)
  - True Random Number Generator (TRNG)
- **Hardware CRC Engine**
  - Single-cycle computation with 8/16/32-bit data and 16-bit (programmable)/32-bit (fixed) polynomial
- **Security Management Unit (SMU)**
  - Fine-grained access control for on-chip peripherals
- **Integrated Low-energy LCD Controller with up to 8 $\times$ 36 segments**
  - Voltage boost, contrast and autonomous animation
  - Patented low-energy LCD driver
- **Backup Power Domain**
  - RTCC and retention registers in a separate power domain, available down to energy mode EM4H
  - Operation from backup battery when main power absent/insufficient
- **Ultra Low-Power Precision Analog Peripherals**
  - 2 $\times$  12-bit 1 Msamples/s Analog to Digital Converter (ADC)
    - On-chip temperature sensor
  - 2 $\times$  12-bit 500 ksamples/s Digital to Analog Converter (VDAC)
  - Digital to Analog Current Converter (IDAC)
  - Up to 3 $\times$  Analog Comparator (ACMP)
  - Up to 4 $\times$  Operational Amplifier (OPAMP)
  - Robust current-based capacitive sensing with wake-on-touch (CSEN)
  - Up to 83 GPIO pins are analog-capable. Flexible analog peripheral-to-pin routing via Analog Port (APORT)
  - Supply Voltage Monitor

- **Timers/Counters**
  - 4× 16-bit Timer/Counter
    - 3 or 4 Compare/Capture/PWM channels
    - Dead-Time Insertion on two timer instances
  - 2× 32-bit Timer/Counter
    - 3 or 4 Compare/Capture/PWM channels
    - Dead-Time Insertion on one timer instance
  - 32-bit Real Time Counter and Calendar (RTCC)
  - 24-bit Real Time Counter (RTC)
  - 32-bit Ultra Low Energy CRYOTIMER for periodic wakeup from any Energy Mode
  - 2× 16-bit Low Energy Timer for waveform generation
  - 3× 16-bit Pulse Counter with asynchronous operation
  - 2× Watchdog Timer with dedicated RC oscillator
- **Low Energy Sensor Interface (LESENSE)**
  - Autonomous sensor monitoring in Deep Sleep Mode
  - Wide range of sensors supported, including LC sensors and capacitive buttons
  - Up to 16 inputs
- **Ultra Efficient Power-on Reset and Brown-Out Detector**
- **Debug Interface**
  - 2-pin Serial Wire Debug interface
  - 1-pin Serial Wire Viewer
  - 4-pin JTAG interface
  - Embedded Trace Macrocell (ETM)
- **Pre-Programmed Bootloader**
- **Wide Operating Range**
  - 1.8 V to 3.8 V single power supply
  - Integrated DC-DC, down to 1.8 V output with up to 200 mA load current for system
  - Standard (-40 °C to 85 °C T<sub>AMB</sub>) and Extended (-40 °C to 125 °C T<sub>J</sub>) temperature grades available
- **Packages**
  - QFN64 (9x9 mm)
  - TQFP64 (10x10 mm)
  - TQFP100 (14x14 mm)
  - BGA112 (10x10 mm)
  - BGA120 (7x7 mm)

### 3. System Overview

#### 3.1 Introduction

The Giant Gecko Series 1 product family is well suited for any battery operated application as well as other systems requiring high performance and low energy consumption. This section gives a short introduction to the MCU system. The detailed functional description can be found in the Giant Gecko Series 1 Reference Manual.

A block diagram of the Giant Gecko Series 1 family is shown in [Figure 3.1 Detailed EFM32GG12 Block Diagram on page 11](#). The diagram shows a superset of features available on the family, which vary by OPN. For more information about specific device features, consult [Ordering Information](#).

Figure 3.1. Detailed EFM32GG12 Block Diagram

## 3.2 Power

The EFM32GG12 has an Energy Management Unit (EMU) and efficient integrated regulators to generate internal supply voltages. Only a single external supply voltage is required, from which all internal voltages are created. A 5 V regulator is available on some OPNs, allowing the device to be powered directly from 5 V power sources, such as USB. An optional integrated DC-DC buck regulator can be utilized to further reduce the current consumption. The DC-DC regulator requires one external inductor and one external capacitor.

The EFM32GG12 device family includes support for internal supply voltage scaling, as well as two different power domain groups for peripherals. These enhancements allow for further supply current reductions and lower overall power consumption.

AVDD and VREGVDD need to be 1.8 V or higher for the MCU to operate across all conditions; however the rest of the system will operate down to 1.62 V, including the digital supply and I/O. This means that the device is fully compatible with 1.8 V components. Running from a sufficiently high supply, the device can use the DC-DC to regulate voltage not only for itself, but also for other PCB components, supplying up to a total of 200 mA.

### 3.2.1 Energy Management Unit (EMU)

The Energy Management Unit manages transitions of energy modes in the device. Each energy mode defines which peripherals and features are available and the amount of current the device consumes. The EMU can also be used to turn off the power to unused RAM blocks, and it contains control registers for the DC-DC regulator and the Voltage Monitor (VMON). The VMON is used to monitor multiple supply voltages. It has multiple channels which can be programmed individually by the user to determine if a sensed supply has fallen below a chosen threshold.

### 3.2.2 DC-DC Converter

The DC-DC buck converter covers a wide range of load currents and provides up to 90% efficiency in energy modes EM0, EM1, EM2 and EM3, and can supply up to 200 mA to the device and surrounding PCB components. Protection features include programmable current limiting, short-circuit protection, and dead-time protection. The DC-DC converter may also enter bypass mode when the input voltage is too low for efficient operation. In bypass mode, the DC-DC input supply is internally connected directly to its output through a low resistance switch. Bypass mode also supports in-rush current limiting to prevent input supply voltage droops due to excessive output current transients.

### 3.2.3 5 V Regulator

A 5 V input regulator is available, allowing the device to be powered directly from 5 V power sources such as the USB VBUS line. The regulator is available in all energy modes, and outputs 3.3 V to be used to power the USB PHY and other 3.3 V systems. Two inputs to the regulator allow for seamless switching between local and external power sources.

### 3.2.4 EM2 and EM3 Power Domains

The EFM32GG12 has three independent peripheral power domains for use in EM2 and EM3. Two of these domains are dynamic and can be shut down to save energy. Peripherals associated with the two dynamic power domains are listed in [Table 3.1 EM2 and EM3 Peripheral Power Subdomains on page 13](#). If all of the peripherals in a peripheral power domain are unused, the power domain for that group will be powered off in EM2 and EM3, reducing the overall current consumption of the device. Other EM2, EM3, and EM4-capable peripherals and functions not listed in the table below reside on the primary power domain, which is always on in EM2 and EM3.

**Table 3.1. EM2 and EM3 Peripheral Power Subdomains**

### 3.3 General Purpose Input/Output (GPIO)

EFM32GG12 has up to 95 General Purpose Input/Output pins. GPIO are organized on three independent supply rails, allowing for interface to multiple logic levels in the system simultaneously. Each GPIO pin can be individually configured as either an output or input. More advanced configurations including open-drain, open-source, and glitch-filtering can be configured for each individual GPIO pin. The GPIO pins can be overridden by peripheral connections, like SPI communication. Each peripheral connection can be routed to several GPIO pins on the device. The input value of a GPIO pin can be routed through the Peripheral Reflex System to other peripherals. The GPIO subsystem supports asynchronous external pin interrupts.

### 3.4 Clocking

#### 3.4.1 Clock Management Unit (CMU)

The Clock Management Unit controls oscillators and clocks in the EFM32GG12. Individual enabling and disabling of clocks to all peripherals is performed by the CMU. The CMU also controls enabling and configuration of the oscillators. A high degree of flexibility allows software to optimize energy consumption in any specific application by minimizing power dissipation in unused peripherals and oscillators.

### 3.4.2 Internal and External Oscillators

The EFM32GG12 supports two crystal oscillators and fully integrates five RC oscillators, listed below.

- A high frequency crystal oscillator (HFXO) with integrated load capacitors, tunable in small steps, provides a precise timing reference for the MCU. Crystal frequencies in the range from 4 to 50 MHz are supported. An external clock source such as a TCXO can also be applied to the HFXO input for improved accuracy over temperature.
- A 32.768 kHz crystal oscillator (LFXO) provides an accurate timing reference for low energy modes.
- An integrated high frequency RC oscillator (HFRCO) is available for the MCU system. The HFRCO employs fast startup at minimal energy consumption combined with a wide frequency range. When crystal accuracy is not required, it can be operated in free-running mode at a number of factory-calibrated frequencies. A digital phase-locked loop (DPLL) feature allows the HFRCO to achieve higher accuracy and stability by referencing other available clock sources such as LFXO and HFXO.
- An integrated auxiliary high frequency RC oscillator (AUXHFRCO) is available for timing the general-purpose ADC and the Serial Wire Viewer port with a wide frequency range.
- An integrated universal high frequency RC oscillator (USHFRCO) is available for timing the USB, SDIO and QSPI peripherals. The USHFRCO can be synchronized to the host's USB clock to allow the USB to operate in device mode without the additional cost of an external crystal.
- An integrated low frequency 32.768 kHz RC oscillator (LFRCO) can be used as a timing reference in low energy modes, when crystal accuracy is not required.
- An integrated ultra-low frequency 1 kHz RC oscillator (ULFRCO) is available to provide a timing reference at the lowest energy consumption in low energy modes.

### 3.5 Counters/Timers and PWM

#### 3.5.1 Timer/Counter (TIMER)

TIMER peripherals keep track of timing, count events, generate PWM outputs and trigger timed actions in other peripherals through the PRS system. The core of each TIMER is a 16-bit counter with up to 4 compare/capture channels. Each channel is configurable in one of three modes. In capture mode, the counter state is stored in a buffer at a selected input event. In compare mode, the channel output reflects the comparison of the counter to a programmed threshold value. In PWM mode, the TIMER supports generation of pulse-width modulation (PWM) outputs of arbitrary waveforms defined by the sequence of values written to the compare registers, with optional dead-time insertion available in timer unit TIMER\_0 only.

#### 3.5.2 Wide Timer/Counter (WTIMER)

WTIMER peripherals function just as TIMER peripherals, but are 32 bits wide. They keep track of timing, count events, generate PWM outputs and trigger timed actions in other peripherals through the PRS system. The core of each WTIMER is a 32-bit counter with up to 4 compare/capture channels. Each channel is configurable in one of three modes. In capture mode, the counter state is stored in a buffer at a selected input event. In compare mode, the channel output reflects the comparison of the counter to a programmed threshold value. In PWM mode, the WTIMER supports generation of pulse-width modulation (PWM) outputs of arbitrary waveforms defined by the sequence of values written to the compare registers, with optional dead-time insertion available in timer unit WTIMER\_0 only.

#### 3.5.3 Real Time Counter and Calendar (RTCC)

The Real Time Counter and Calendar (RTCC) is a 32-bit counter providing timekeeping in all energy modes. The RTCC includes a Binary Coded Decimal (BCD) calendar mode for easy time and date keeping. The RTCC can be clocked by any of the on-board oscillators with the exception of the AUXHFRCO, and it is capable of providing system wake-up at user defined instances. The RTCC includes 128 bytes of general purpose data retention, allowing easy and convenient data storage in all energy modes down to EM4H.

#### 3.5.4 Low Energy Timer (LETIMER)

The unique LETIMER is a 16-bit timer that is available in energy mode EM2 Deep Sleep in addition to EM1 Sleep and EM0 Active. This allows it to be used for timing and output generation when most of the device is powered down, allowing simple tasks to be performed while the power consumption of the system is kept at an absolute minimum. The LETIMER can be used to output a variety of waveforms with minimal software intervention. The LETIMER is connected to the Real Time Counter and Calendar (RTCC), and can be configured to start counting on compare matches from the RTCC.

#### 3.5.5 Ultra Low Power Wake-up Timer (CRYOTIMER)

The CRYOTIMER is a 32-bit counter that is capable of running in all energy modes. It can be clocked by either the 32.768 kHz crystal oscillator (LFXO), the 32.768 kHz RC oscillator (LFRCO), or the 1 kHz RC oscillator (ULFRCO). It can provide periodic Wakeup events and PRS signals which can be used to wake up peripherals from any energy mode. The CRYOTIMER provides a wide range of interrupt periods, facilitating flexible ultra-low energy operation.

### 3.5.6 Pulse Counter (PCNT)

The Pulse Counter (PCNT) peripheral can be used for counting pulses on a single input or to decode quadrature encoded inputs. The clock for PCNT is selectable from either an external source on pin PCTNn\_S0IN or from an internal timing reference, selectable from among any of the internal oscillators, except the AUXHFRCO. The peripheral may operate in energy mode EM0 Active, EM1 Sleep, EM2 Deep Sleep, and EM3 Stop.

### 3.5.7 Watchdog Timer (WDOG)

The watchdog timer can act both as an independent watchdog or as a watchdog synchronous with the CPU clock. It has windowed monitoring capabilities, and can generate a reset or different interrupts depending on the failure mode of the system. The watchdog can also monitor autonomous systems driven by PRS.

## 3.6 Communications and Other Digital Peripherals

### 3.6.1 Universal Synchronous/Asynchronous Receiver/Transmitter (USART)

The Universal Synchronous/Asynchronous Receiver/Transmitter is a flexible serial I/O interface. It supports full duplex asynchronous UART communication with hardware flow control as well as RS-485, SPI, MicroWire and 3-wire. It can also interface with devices supporting:

- ISO7816 SmartCards
- IrDA
- I<sup>2</sup>S

### 3.6.2 Universal Asynchronous Receiver/Transmitter (UART)

The Universal Asynchronous Receiver/Transmitter is a subset of the USART peripheral, supporting full duplex asynchronous UART communication with hardware flow control and RS-485.

### 3.6.3 Low Energy Universal Asynchronous Receiver/Transmitter (LEUART)

The unique LEUART<sup>TM</sup> provides two-way UART communication on a strict power budget. Only a 32.768 kHz clock is needed to allow UART communication up to 9600 baud. The LEUART includes all necessary hardware to make asynchronous serial communication possible with a minimum of software intervention and energy consumption.

### 3.6.4 Inter-Integrated Circuit Interface (I<sup>2</sup>C)

The I<sup>2</sup>C interface enables communication between the MCU and a serial I<sup>2</sup>C bus. It is capable of acting as both a master and a slave and supports multi-master buses. Standard-mode, fast-mode and fast-mode plus speeds are supported, allowing transmission rates from 10 kbit/s up to 1 Mbit/s. Slave arbitration and timeouts are also available, allowing implementation of an SMBus-compliant system. The interface provided to software by the I<sup>2</sup>C peripheral allows precise timing control of the transmission process and highly automated transfers. Automatic recognition of slave addresses is provided in active and low energy modes.

### 3.6.5 External Bus Interface (EBI)

The External Bus Interface provides access to external parallel interface devices. The interface is memory mapped into the address bus of the Cortex-M4. This enables seamless access from software without manually manipulating the I/O settings each time a read or write is performed. The data and address lines are multiplexed in order to reduce the number of pins required to interface to external devices. Timing is adjustable to meet specifications of the external devices. The interface is limited to asynchronous devices.

The EBI contains a TFT controller which can drive a TFT via an RGB interface. The TFT controller supports programmable display and port sizes and offers accurate control of frequency and setup and hold timing. Direct Drive is supported for TFT displays which do not have their own frame buffer. In that case TFT Direct Drive can transfer data from either on-chip memory or from an external memory device to the TFT at low CPU load. Automatic alpha-blending and masking is also supported for transfers through the EBI interface.

### 3.6.6 Quad-SPI Flash Controller (QSPI)

The QSPI provides access to a wide range of flash devices with wide I/O busses. The I/O and clocking configuration is flexible and supports many types of devices. Up to 8-bit wide interfaces are supported. The QSPI handles opcodes, status flag polling, and timing configuration automatically.

The external flash memory is mapped directly to internal memory to allow random access to any word in the flash and direct code execution. An integrated instruction cache minimizes latency and allows efficient code execution. Execute in Place (XIP) is supported for devices with this feature.

Large data chunks can be transferred with DMA as efficiently as possible with high throughput and minimal bus load, utilizing an integrated 1 kB SRAM FIFO.

### 3.6.7 SDIO Host Controller (SDIO)

The SDIO is an SD3.01 / SDIO3.0 / eMMC4.51-compliant Host Controller interface for transferring data to and from SD/MMC/SDIO devices. The module conforms to the SD Host Controller Standard Specification Version 3.00. The Host Controller handles SDIO/SD/MMC Protocol at the transmission level, packing data, adding cyclic redundancy check (CRC), Start/End bits, and checking for transaction format correctness.

### 3.6.8 Universal Serial Bus (USB)

The USB is a full-speed/low-speed USB 2.0 compliant host/device controller. The USB can be used in device and host-only configurations, while a clock recovery mechanism allows crystal-less operation in device mode. The USB block supports both full speed (12 MBit/s) and low speed (1.5 MBit/s) operation. When operating as a device, a special Low Energy Mode ensures the current consumption is optimized, enabling USB communications on a strict power budget. The USB device includes an internal dedicated Descriptor-Based Scatter/Gather DMA and supports up to 6 OUT endpoints and 6 IN endpoints, in addition to endpoint 0. The on-chip PHY includes internal pull-up and pull-down resistors, as well as voltage comparators for monitoring the VBUS voltage and A/B device identification using the ID line.

### 3.6.9 Controller Area Network (CAN)

The CAN peripheral provides support for communication at up to 1 Mbps over CAN protocol version 2.0 part A and B. It includes 32 message objects with independent identifier masks and retains message RAM in EM2. Automatic retransmission may be disabled in order to support Time Triggered CAN applications.

### 3.6.10 Peripheral Reflex System (PRS)

The Peripheral Reflex System provides a communication network between different peripherals without software involvement. Peripherals producing Reflex signals are called producers. The PRS routes Reflex signals from producers to consumer peripherals, which in turn perform actions in response. Edge triggers and other functionality such as simple logic operations (AND, OR, NOT) can be applied by the PRS to the signals. The PRS allows peripheral to act autonomously without waking the MCU core, saving power.

### 3.6.11 Low Energy Sensor Interface (LESENSE)

The Low Energy Sensor Interface LESENSE™ is a highly configurable sensor interface with support for up to 16 individually configurable sensors. By controlling the analog comparators, ADC, and DAC, LESENSE is capable of supporting a wide range of sensors and measurement schemes, and can for instance measure LC sensors, resistive sensors and capacitive sensors. LESENSE also includes a programmable finite state machine which enables simple processing of measurement results without CPU intervention. LESENSE is available in energy mode EM2, in addition to EM0 and EM1, making it ideal for sensor monitoring in applications with a strict energy budget.

### 3.6.12 Pulse Density Modulation (PDM) Interface

The PDM module provides a serial interface and decimation filter for Pulse Density Modulation (PDM) microphones, isolated Sigma-delta ADCs, digital sensors and other PDM or sigma delta bit stream peripherals. A programmable Cascaded Integrator Comb (CIC) filter is used to decimate the incoming bit streams. PDM supports multiple channels of stereo or mono input data and DMA transfer.

## 3.7 Security Features

### 3.7.1 General Purpose Cyclic Redundancy Check (GPCRC)

The GPCRC block implements a Cyclic Redundancy Check (CRC) function. It supports both 32-bit and 16-bit polynomials. The supported 32-bit polynomial is 0x04C11DB7 (IEEE 802.3), while the 16-bit polynomial can be programmed to any value, depending on the needs of the application.

### 3.7.2 Crypto Accelerator (CRYPTO)

The Crypto Accelerator is a fast and energy-efficient autonomous hardware encryption and decryption accelerator. Giant Gecko Series 1 devices support AES encryption and decryption with 128- or 256-bit keys, ECC over both GF(P) and GF(2<sup>m</sup>), and SHA-1 and SHA-2 (SHA-224 and SHA-256).

Supported block cipher modes of operation for AES include: ECB, CTR, CBC, PCBC, CFB, OFB, GCM, CBC-MAC, GMAC and CCM.

Supported ECC NIST recommended curves include P-192, P-224, P-256, K-163, K-233, B-163 and B-233.

The CRYPTO peripheral allows fast processing of GCM (AES), ECC and SHA with little CPU intervention. CRYPTO also provides trigger signals for DMA read and write operations.

### 3.7.3 True Random Number Generator (TRNG)

The TRNG is a non-deterministic random number generator based on a full hardware solution. The TRNG is validated with NIST800-22 and AIS-31 test suites as well as being suitable for FIPS 140-2 certification (for the purposes of cryptographic key generation).

### 3.7.4 Security Management Unit (SMU)

The Security Management Unit (SMU) allows software to set up fine-grained security for peripheral access, which is not possible in the Memory Protection Unit (MPU). Peripherals may be secured by hardware on an individual basis, such that only privileged accesses to the peripheral's register interface will be allowed. When an access fault occurs, the SMU reports the specific peripheral involved and can optionally generate an interrupt.

## 3.8 Analog

### 3.8.1 Analog Port (APORT)

The Analog Port (APORT) is an analog interconnect matrix allowing access to many analog peripherals on a flexible selection of pins. Each APORT bus consists of analog switches connected to a common wire. Since many clients can operate differentially, buses are grouped by X/Y pairs.

### 3.8.2 Analog Comparator (ACMP)

The Analog Comparator is used to compare the voltage of two analog inputs, with a digital output indicating which input voltage is higher. Inputs are selected from among internal references and external pins. The tradeoff between response time and current consumption is configurable by software. Two 6-bit reference dividers allow for a wide range of internally-programmable reference sources. The ACMP can also be used to monitor the supply voltage. An interrupt can be generated when the supply falls below or rises above the programmable threshold.

### 3.8.3 Analog to Digital Converter (ADC)

The ADC is a Successive Approximation Register (SAR) architecture, with a resolution of up to 12 bits at up to 1 Msps. The output sample resolution is configurable and additional resolution is possible using integrated hardware for averaging over multiple samples. The ADC includes integrated voltage references and an integrated temperature sensor. Inputs are selectable from a wide range of sources, including pins configurable as either single-ended or differential.

### 3.8.4 Capacitive Sense (CSEN)

The CSEN peripheral is a dedicated Capacitive Sensing block for implementing touch-sensitive user interface elements such as switches and sliders. The CSEN peripheral uses a charge ramping measurement technique, which provides robust sensing even in adverse conditions including radiated noise and moisture. The peripheral can be configured to take measurements on a single port pin or scan through multiple pins and store results to memory through DMA. Several channels can also be shorted together to measure the combined capacitance or implement wake-on-touch from very low energy modes. Hardware includes a digital accumulator and an averaging filter, as well as digital threshold comparators to reduce software overhead.

### 3.8.5 Digital to Analog Current Converter (IDAC)

The IDAC can source or sink a configurable constant current. This current can be driven on an output pin or routed to the selected ADC input pin for capacitive sensing. The full-scale current is programmable between 0.05  $\mu\text{A}$  and 64  $\mu\text{A}$  with several ranges consisting of various step sizes.

### 3.8.6 Digital to Analog Converter (VDAC)

The Digital to Analog Converter (VDAC) can convert a digital value to an analog output voltage. The VDAC is a fully differential, 500 ksp/s, 12-bit converter. The opamps are used in conjunction with the VDAC, to provide output buffering. One opamp is used per single-ended channel, or two opamps are used to provide differential outputs. The VDAC may be used for a number of different applications such as sensor interfaces or sound output. The VDAC can generate high-resolution analog signals while the MCU is operating at low frequencies and with low total power consumption. Using DMA and a timer, the VDAC can be used to generate waveforms without any CPU intervention. The VDAC is available in all energy modes down to and including EM3.

### 3.8.7 Operational Amplifiers

The opamps are low power amplifiers with a high degree of flexibility targeting a wide variety of standard opamp application areas, and are available down to EM3. With flexible built-in programming for gain and interconnection they can be configured to support multiple common opamp functions. All pins are also available externally for filter configurations. Each opamp has a rail to rail input and a rail to rail output. They can be used in conjunction with the VDAC peripheral or in stand-alone configurations. The opamps save energy, PCB space, and cost as compared with standalone opamps because they are integrated on-chip.

### 3.8.8 Liquid Crystal Display Driver (LCD)

The LCD driver is capable of driving a segmented LCD display with up to 8x36 segments. A voltage boost function enables it to provide the LCD display with higher voltage than the supply voltage for the device. A patented charge redistribution driver can reduce the LCD module supply current by up to 40%. In addition, an animation feature can run custom animations on the LCD display without any CPU intervention. The LCD driver can also remain active even in Energy Mode 2 and provides a Frame Counter interrupt that can wake-up the device on a regular basis for updating data.

## 3.9 Reset Management Unit (RMU)

The RMU is responsible for handling reset of the EFM32GG12. A wide range of reset sources are available, including several power supply monitors, pin reset, software controlled reset, core lockup reset, and watchdog reset.

## 3.10 Core and Memory

### 3.10.1 Processor Core

The ARM Cortex-M processor includes a 32-bit RISC processor integrating the following features and tasks in the system:

- ARM Cortex-M4 RISC processor with FPU achieving 1.25 Dhrystone MIPS/MHz
- Memory Protection Unit (MPU) supporting up to 8 memory segments
- Embedded Trace Macrocell (ETM) for real-time trace and debug
- Up to 1024 kB flash program memory
  - Dual-bank memory with read-while-write support
- Up to 192 kB RAM data memory
- Configuration and event handling of all modules
- 2-pin Serial-Wire or 4-pin JTAG debug interface

### 3.10.2 Memory System Controller (MSC)

The Memory System Controller (MSC) is the program memory unit of the microcontroller. The flash memory is readable and writable from both the Cortex-M and DMA. The flash memory is divided into two blocks; the main block and the information block. Program code is normally written to the main block, whereas the information block is available for special user data and flash lock bits. There is also a read-only page in the information block containing system and device calibration data. Read and write operations are supported in energy modes EM0 Active and EM1 Sleep.

### 3.10.3 Linked Direct Memory Access Controller (LDMA)

The Linked Direct Memory Access (LDMA) controller allows the system to perform memory operations independently of software. This reduces both energy consumption and software workload. The LDMA allows operations to be linked together and staged, enabling sophisticated operations to be implemented.

### 3.10.4 Bootloader

All devices come pre-programmed with a UART bootloader. This bootloader resides in flash and can be erased if it is not needed. More information about the bootloader protocol and usage can be found in *AN0003: UART Bootloader*. Application notes can be found on the Silicon Labs website ([www.silabs.com/32bit-appnotes](http://www.silabs.com/32bit-appnotes)) or within Simplicity Studio in the [Documentation] area.

## 4. Electrical Specifications

### 4.1 Electrical Characteristics

All electrical parameters in all tables are specified under the following conditions, unless stated otherwise:

- Typical values are based on  $T_{AMB}=25\text{ }^{\circ}\text{C}$  and  $V_{DD}=3.3\text{ V}$ , by production test and/or technology characterization.
- Minimum and maximum values represent the worst conditions across supply voltage, process variation, and operating temperature, unless stated otherwise.

Refer to [4.1.2.1 General Operating Conditions](#) for more details about operational supply and temperature limits.

### 4.1.1 Absolute Maximum Ratings

Stresses above those listed below may cause permanent damage to the device. This is a stress rating only and functional operation of the devices at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. For more information on the available quality and reliability data, see the Quality and Reliability Monitor Report at <http://www.silabs.com/support/quality/pages/default.aspx>.

**Table 4.1. Absolute Maximum Ratings**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Storage temperature range	T <sub>STG</sub>		-50	—	150	°C
Voltage on supply pins other than VREGI and VBUS	V <sub>DDMAX</sub>		-0.3	—	3.8	V
Voltage ramp rate on any supply pin	V <sub>DDRAMPMAX</sub>		—	—	1	V / $\mu$ s
DC voltage on any GPIO pin	V <sub>DIGPIN</sub>	5V tolerant GPIO pins <sup>1 2 3</sup>	-0.3	—	Min of 5.25 and IOVDD +2	V
		LCD pins <sup>3</sup>	-0.3	—	Min of 3.8 and IOVDD +2	V
		Standard GPIO pins	-0.3	—	IOVDD+0.3	V
Total current into VDD power lines	I <sub>VDDMAX</sub>	Source	—	—	200	mA
Total current into VSS ground lines	I <sub>VSSMAX</sub>	Sink	—	—	200	mA
Current per I/O pin	I <sub>IOMAX</sub>	Sink	—	—	50	mA
		Source	—	—	50	mA
Current for all I/O pins	I <sub>IOALLMAX</sub>	Sink	—	—	200	mA
		Source	—	—	200	mA
Junction temperature	T <sub>J</sub>	-G grade devices	-40	—	105	°C
		-I grade devices	-40	—	125	°C
Voltage on regulator supply pins VREGI and VBUS	V <sub>VREGI</sub>		-0.3	—	5.5	V

**Note:**

1. When a GPIO pin is routed to the analog block through the APORT, the maximum voltage = IOVDD.
2. Valid for IOVDD in valid operating range or when IOVDD is undriven (high-Z). If IOVDD is connected to a low-impedance source below the valid operating range (e.g. IOVDD shorted to VSS), the pin voltage maximum is IOVDD + 0.3 V, to avoid exceeding the maximum IO current specifications.
3. To operate above the IOVDD supply rail, over-voltage tolerance must be enabled according to the GPIO\_Px\_OVTDIS register. Pins with over-voltage tolerance disabled have the same limits as Standard GPIO.

#### 4.1.2 Operating Conditions

When assigning supply sources, the following requirements must be observed:

- VREGVDD must be greater than or equal to AVDD, DVDD and all IOVDD supplies.
- VREGVDD = AVDD
- DVDD  $\leq$  AVDD
- IOVDD  $\leq$  AVDD

#### 4.1.2.1 General Operating Conditions

		VSCALE0	—	—	20	MHz

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
<b>Note:</b>						
1. The maximum limit on $T_A$ may be lower due to device self-heating, which depends on the power dissipation of the specific application. $T_A$ (max) = $T_J$ (max) - ( $\text{THETA}_{JA} \times \text{PowerDissipation}$ ). Refer to the Absolute Maximum Ratings table and the Thermal Characteristics table for $T_J$ and $\text{THETA}_{JA}$ .						
2. VREGVDD must be tied to AVDD. Both VREGVDD and AVDD minimum voltages must be satisfied for the part to operate.						
3. The minimum voltage required in bypass mode is calculated using $R_{BYP}$ from the DCDC specification table. Requirements for other loads can be calculated as $V_{DVDD\_min} + I_{LOAD} * R_{BYP\_max}$ .						
4. When the CSEN peripheral is used with chopping enabled (CSEN_CTRL_CHOPEN = ENABLE), IOVDD must be equal to AVDD.						
5. The system designer should consult the characteristic specs of the capacitor used on DECOUPLE to ensure its capacitance value stays within the specified bounds across temperature and DC bias.						
6. VSCALE0 to VSCALE2 voltage change transitions occur at a rate of 10 mV / usec for approximately 20 usec. During this transition, peak currents will be dependent on the value of the DECOUPLE output capacitor, from 35 mA (with a 1 $\mu$ F capacitor) to 70 mA (with a 2.7 $\mu$ F capacitor).

DCDC nominal output inductor	L <sub>DCDC</sub>	20% tolerance	4.7	4.7	4.7	µH
Resistance in Bypass mode	R <sub>BYP</sub>		—	1.2	2.5	Ω

**Note:**

1. Due to internal dropout, the DC-DC output will never be able to reach its input voltage, V<sub>VREGVDD</sub>.
2. LP mode controller is a hysteretic controller that maintains the output voltage within the specified limits.
3. LPCMPBIASEMxx refers to either LPCMPBIASEM234H in the EMU\_DCDCMISCCTRL register or LPCMPBIASEM01 in the EMU\_DCDCLOEM01CFG register, depending on the energy mode.
4. Drive levels are defined by configuration of the PFETCNT and NFETCNT registers. Light Drive: PFETCNT=NFETCNT=3; Medium Drive: PFETCNT=NFETCNT=7; Heavy Drive: PFETCNT=NFETCNT=15.
5. Output voltage under/over-shoot and regulation are specified with C<sub>DCDC</sub> 4.7 µF. Different settings for DCDCLNCOMPCTRL must be used if C<sub>DCDC</sub> is lower than 4.7 µF. See Application Note AN0948 for details.

#### 4.1.5 5V Regulator

$V_{VREGI} = 5\text{ V}$ ,  $V_{VREGO} = 3.3\text{ V}$ ,  $C_{VREGI} = 10\text{ }\mu\text{F}$ ,  $C_{VREGO} = 4.7\text{ }\mu\text{F}$ , unless otherwise specified.

VREGO bypass capacitance	$C_{VREGO}$		1	4.7	10	$\mu\text{F}$
Supply current consumption	$I_{VREGI}$	EM0 or EM1, No load	—	29	—	$\mu\text{A}$
		EM2, EM3, or EM4H, No load	—	270	—	nA
		EM4S, No load	—	70	—	nA
VREGI and VBUS detection high threshold	$V_{DET\_H}$		0.9	1.15	—	V
VREGI and VBUS detection low threshold	$V_{DET\_L}$		—	1.07	1.45	V
Current monitor transfer ratio	$IMON_{XF}$	Translation of current through VREGO path to voltage at ADC input	—	0.35	—	mA/mV

**Note:**

- Output may be disturbed during DCDC mode transitions from BYPASS or OFF mode to LOWNOISE mode. Perturbation on VREGO can temporarily bring VREGO up beyond 3.5 V during these DCDC mode transitions. Refer to the EFM32GG12 Errata document, item EMU\_E219 for more details.

#### 4.1.6 Backup Supply Domain

**Table 4.6. Backup Supply Domain**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Backup supply voltage range	V <sub>BU_VIN</sub>		1.8	—	3.8	V

		EMU_BUCTRL_VOUTRES = WEAK	5600	6500	7400	Ω
Supply current	I <sub>BU_VIN</sub>	BU_VIN not powering backup domain, 25 °C	—	11	70	nA
		BU_VIN powering backup domain, 25 °C <sup>2</sup>	—	550	2500	nA

**Note:**

1. BU\_VOUT and BU\_STAT signals are not available in all package configurations. Check the device pinout for availability.
2. Additional current required by backup circuitry when backup is active. Includes supply current of backup switches and backup regulator. Does not include supply current required for backed-up circuitry.

## 4.1.7 Current Consumption

### 4.1.7.1 Current Consumption 3.3 V without DC-DC Converter

Unless otherwise indicated, typical conditions are: VREGVDD = AVDD = DVDD = 3.3 V. T = 25 °C. DCDC is off. Minimum and maximum values in this table represent the worst conditions across process variation at T = 25 °C.

Wake up from EM4S <sup>1</sup>	$t_{EM4S\_WU}$	Executing from flash	—	288	—	$\mu\text{s}$
Time from release of reset source to first instruction execution	$t_{RESET}$	Soft Pin Reset released	—	53	—	$\mu\text{s}$
		Any other reset released	—	347	—	$\mu\text{s}$
Power mode scaling time	$t_{SCALE}$	VSCALE0 to VSCALE2, HFCLK = 19 MHz <sup>2 3</sup>	—	31.8	—	$\mu\text{s}$
		VSCALE2 to VSCALE0, HFCLK = 19 MHz <sup>4</sup>	—	4.3	—	$\mu\text{s}$

**Note:**

1. Time from wake up request until first instruction is executed. Wakeup results in device reset.
2. Scaling up from VSCALE0 to VSCALE2 requires approximately  $30.3 \mu\text{s} + 28 \text{ HFCLKs}$ .
3. VSCALE0 to VSCALE2 voltage change transitions occur at a rate of  $10 \text{ mV}/\mu\text{s}$  for approximately  $20 \mu\text{s}$ . During this transition, peak currents will be dependent on the value of the DECOUPLE output capacitor, from 35 mA (with a  $1 \mu\text{F}$  capacitor) to 70 mA (with a  $2.7 \mu\text{F}$  capacitor).
4. Scaling down from VSCALE2 to VSCALE0 requires approximately  $2.8 \mu\text{s} + 29 \text{ HFCLKs}$ .

**Note:**

- The absolute voltage allowed at any ADC input is dictated by the power rail supplied to on-chip circuitry, and may be lower than the effective full scale voltage. All ADC inputs are limited to the ADC supply (AVDD or DVDD depending on EMU\_PWRCTRL\_ANASW). Any ADC input routed through the APORT will further be limited by the IOVDD supply to the pin.
- PSRR is referenced to AVDD when ANASW=0 and to DVDD when ANASW=1 in EMU\_PWRCTRL.
- In ADCn\_CTRL register.
- In ADCn\_BIASPROG register.
- Derived from ADCCLK.
- Internal reference option used corresponds to selection 2V5 in the SINGLECTRL\_REF or SCANCTRL\_REF register field. The differential input range with this configuration is  $\pm 1.25\text{ V}$ . Typical value is characterized using full-scale sine wave input. Minimum value is production-tested using sine wave input at 1.5 dB lower than full scale.
- External reference is 1.25 V applied externally to ADCnEXTREFP, with the selection CONF in the SINGLECTRL\_REF or SCANCTRL\_REF register field and VREFP in the SINGLECTRLX\_VREFSEL or SCANCTRLX\_VREFSEL field. The differential input range with this configuration is  $\pm 1.25\text{ V}$ .

**Note:**

- Current is specified with a total external capacitance of 33 pF per channel. Average current is dependent on how long the peripheral is actively sampling channels within the scan period, and scales with the number of samples acquired. Supply current for a specific application can be estimated by multiplying the current per sample by the total number of samples per period (total\_current = single\_sample\_current \* (number\_of\_channels \* accumulation)).

<b>Note:</b>						
1. Specified configuration for Unit gain buffer configuration is: INCBW = 0, HCMDIS = 0, RESINSEL = DISABLE. $V_{INPUT} = 0.5\text{ V}$ , $V_{OUTPUT} = 0.5\text{ V}$ .						
2. Specified configuration for 3X-Gain configuration is: INCBW = 1, HCMDIS = 1, RESINSEL = VSS, $V_{INPUT} = 0.5\text{ V}$ , $V_{OUTPUT} = 1.5\text{ V}$ . Nominal voltage gain is 3.						
3. If the maximum $C_{LOAD}$ is exceeded, an isolation resistor is required for stability. See AN0038 for more information.						
4. Current into the load resistor is excluded. When the OPAMP is connected with closed-loop gain > 1, there will be extra current to drive the resistor feedback network. The internal resistor feedback network has total resistance of 143.5 kOhm, which will cause another ~10 $\mu\text{A}$ current when the OPAMP drives 1.5 V between output and ground.						
5. In unit gain connection, UGF is the gain-bandwidth product of the OPAMP. In 3x Gain connection, UGF is the gain-bandwidth product of the OPAMP and 1/3 attenuation of the feedback network.						
6. Step between 0.2V and $V_{OPA}-0.2\text{V}$ , 10%-90% rising/falling range.						
7. When INCBW is set to 1 the OPAMP bandwidth is increased. This is allowed only when the non-inverting close-loop gain is $\geq 3$ , or the OPAMP may not be stable.						
8. From enable to output settled. In sample-and-off mode, RC network after OPAMP will contribute extra delay. Settling error < 1mV.						
9. When HCMDIS=1 and input common mode transitions the region from $V_{OPA}-1.4\text{V}$ to $V_{OPA}-1\text{V}$ , input offset will change. PSRR and CMRR specifications do not apply to this transition region.

Supply current <sup>1 2</sup>	I <sub>APORT</sub>	Operation in EM0/EM1	—	7	—	μA
		Operation in EM2/EM3	—	63	—	nA

**Note:**

1. Supply current increase that occurs when an analog peripheral requests access to APORT. This current is not included in reported peripheral currents. Additional peripherals requesting access to APORT do not incur further current.
2. Specified current is for continuous APORT operation. In applications where the APORT is not requested continuously (e.g. periodic ACMP requests from LESENSE in EM2), the average current requirements can be estimated by multiplying the duty cycle of the requests by the specified continuous current number.

**Note:**

1. For CLHR set to 1 in the I2Cn\_CTRL register.
2. For the minimum HPPERCLK frequency required in Fast-mode, refer to the I2C chapter in the reference manual.
3. The maximum SDA hold time ( $t_{HD,DAT}$ ) needs to be met only when the device does not stretch the low time of SCL ( $t_{LOW}$ ).

#### 4.1.25 External Bus Interface (EBI)

##### EBI Write Enable Output Timing

Timing applies to both EBI\_WEn and EBI\_NANDWEn for all addressing modes and both polarities. All numbers are based on route locations 0,1,2 only (with all EBI alternate functions using the same location at the same time). Timing is specified at 10% and 90% of IOVDD, 25 pF external loading, and slew rate for all GPIO set to 6.

**Table 4.36. EBI Write Enable Timing**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Output hold time, from trailing EBI_WEn / EBI_NANDWEn edge to EBI_AD, EBI_A, EBI_CS <sub>n</sub> , EBI_BL <sub>n</sub> invalid	t <sub>OH_WEn</sub>	IOVDD ≥ 1.62 V	-22 + (WRHOLD * t <sub>HFCOR-ECLK</sub> )	—	—	ns
		IOVDD ≥ 3.0 V	-14 + (WRHOLD * t <sub>HFCOR-ECLK</sub> )	—	—	ns
Output setup time, from EBI_AD, EBI_A, EBI_CS <sub>n</sub> , EBI_BL <sub>n</sub> valid to leading EBI_WEn / EBI_NANDWEn edge <sup>1</sup>	t <sub>OSU_WEn</sub>	IOVDD ≥ 1.62 V	-12 + (WRSET-UP * t <sub>HFCOR-ECLK</sub> )	—	—	ns
		IOVDD ≥ 3.0 V	-10 + (WRSET-UP * t <sub>HFCOR-ECLK</sub> )	—	—	ns
EBI_WEn / EBI_NANDWEn pulse width <sup>1</sup>	t <sub>WIDTH_WEn</sub>	IOVDD ≥ 1.62 V	-6 + (MAX(1, WRSTRB) * t <sub>HFCOR-ECLK</sub> )	—	—	ns
		IOVDD ≥ 3.0 V	-5 + (MAX(1, WRSTRB) * t <sub>HFCOR-ECLK</sub> )	—	—	ns

**Note:**

- The figure shows the timing for the case that the half strobe length functionality is not used, i.e. HALFWE=0. The leading edge of EBI\_WEn can be moved to the right by setting HALFWE=1. This decreases the length of t<sub>WIDTH\_WEn</sub> and increases the length of t<sub>OSU\_WEn</sub> by 1/2 \* t<sub>HCLKNODIV</sub>.

**Figure 4.3. EBI Write Enable Output Timing Diagram**

### EBI Address Latch Enable Output Timing

Timing applies to multiplexed addressing modes D8A24ALE and D16A16ALE for both polarities. All numbers are based on route locations 0,1,2 only (with all EBI alternate functions using the same location at the same time). Timing is specified at 10% and 90% of IOVDD, 25 pF external loading, and slew rate for all GPIO set to 6.

		IOVDD ≥ 3.0 V	-4 + ((ADDR-SETUP + 1) * t <sub>HFCOR-ECLK</sub> )	—	—	ns

**Note:**

1. The figure shows the timing for the case that the half strobe length functionality is not used, i.e. HALFALE=0. The trailing edge of EBI\_ALEn can be moved to the left by setting HALFALE=1. This decreases the length of t<sub>WIDTH\_ALEn</sub> and increases the length of t<sub>OSU\_ALEn</sub> by t<sub>HFCORECLK</sub> - 1/2 \* t<sub>HFCLKNODIV</sub>.
2. The figure shows a write operation. For a multiplexed read operation the address hold time is controlled via the RDSETUP state instead of via the ADDRHOLD state.

## EBI Read Enable Output Timing

Timing applies to both EBI\_REn and EBI\_NANDREn for all addressing modes and both polarities. Output timing for EBI\_AD applies only to multiplexed addressing modes D8A24ALE and D16A16ALE. All numbers are based on route locations 0,1,2 only (with all EBI alternate functions using the same location at the same time). Timing is specified at 10% and 90% of IOVDD, 25 pF external loading, and slew rate for all GPIO set to 6.

EBI_REn pulse width <sup>1 2</sup>	t <sub>WIDTH_REn</sub>	IOVDD ≥ 1.62 V	-6 + (MAX(1, RDSTRB) * t <sub>HFCOR-ECLK</sub> )	—	—	ns
		IOVDD ≥ 3.0 V	-4 + (MAX(1, RDSTRB) * t <sub>HFCOR-ECLK</sub> )	—	—	ns

**Note:**

- The figure shows the timing for the case that the half strobe length functionality is not used, i.e. HALFRE=0. The leading edge of EBI\_REn can be moved to the right by setting HALFRE=1. This decreases the length of t<sub>WIDTH\_REn</sub> and increases the length of t<sub>OSU\_REn</sub> by 1/2 \* t<sub>HFCLKNODIV</sub>.
- When page mode is used, RDSTRB is replaced by RDPA for page hits.

### QSPI SDR Flash Timing Example

This example uses timing values from SDR Mode Timing (Optimal Conditions) to demonstrate the calculation of allowable flash timing using the QSPI in SDR mode.

- Using a configured SCLK frequency ( $F_{SCLK}$ ) of 40 MHz:
- The resulting minimum period,  $T(\min) = (1/F_{SCLK}) * 0.965 = 24.125$  ns.
- Flash will see a minimum setup time of  $T/2 - t_{OV} = T/2 - (T/2 - 2.2) = 2.4$  ns.
- Flash will see a minimum hold time of  $T/2 + t_{OH} = T/2 + (T/2 - 19.13) = T - 19.13 = 24.125 - 19.13 = 4.9$  ns.
- Flash can have a maximum output valid time of  $T/2 - t_{SU} = T/2 - (15.33 - T/2) = T - 15.33 = 24.125 - 15.33 = 8.8$  ns.
- Flash can have a minimum output hold time of  $t_H - T/2 = (T/2 - 4.1) - T/2 = -4.1$  ns.

Figure 4.20. QSPI DDR Timing Diagrams

### QSPI DDR Flash Timing Example

This example uses timing values for DDR Mode Timing (Optimal Conditions) to demonstrate the calculation of allowable flash timing using the QSPI in DDR mode.

- Using a configured SCLK frequency ( $F_{SCLK}$ ) of 20 MHz from the HFXO clock source:
- The resulting minimum half-period,  $T/2(\min) = (1/F_{SCLK}) * 0.44 = 22$  ns.
- Flash will see a minimum setup time of  $T/2 - t_{OV} = T/2 - (T/2 - 2.2) = 2.4$  ns.
- Flash will see a minimum hold time of  $t_{OH} = T/2 - 19.02 = 22 - 19.02 = 2.98$  ns.
- Flash can have a maximum output valid time of  $T/2 - t_{SU} = T/2 - 12.93 = 22 - 12.93 = 9.07$  ns.
- Flash can have a minimum output hold time of  $t_H = -0.8$  ns.

#### 4.1.28 PDM

##### PDM Timing

Timing is specified for all route locations, 10 pF to 25 pF loading on PDM\_CLK, and slew rate for PDM\_CLK set to 7.

**Table 4.68. Pulse Density Modulation (PDM) Timing**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
PDM_CLK frequency during data transfer	$F_{\text{PDM\_CLK}}$	Microphone mode, VSCALE2 or VSCALE0	—	—	4.8	MHz
		Sensor mode, VSCALE2	—	—	20	MHz

### 5.21 Alternate Functionality Overview

A wide selection of alternate functionality is available for multiplexing to various pins. The following table shows the name of the alternate functionality in the first column, followed by columns showing the possible LOCATION bitfield settings and the associated GPIO pin. Refer to [5.20 GPIO Functionality Table](#) for a list of functions available on each GPIO pin.

**Note:** Some functionality, such as analog interfaces, do not have alternate settings or a LOCATION bitfield. In these cases, the pinout is shown in the column corresponding to LOCATION 0.

ACMP2_O	0: PD8 1: PE0 2: PE1		Analog comparator ACMP2, digital output.
ADC0_EXTN	0: PD7		Analog to digital converter ADC0 external reference input negative pin.
ADC0_EXTP	0: PD6		Analog to digital converter ADC0 external reference input positive pin.
ADC1_EXTN	0: PD7		Analog to digital converter ADC1 external reference input negative pin.
ADC1_EXTP	0: PD6		Analog to digital converter ADC1 external reference input positive pin.
BOOT_RX	0: PF1		Bootloader RX.
BOOT_TX	0: PF0		Bootloader TX.
BU_STAT	0: PE3		Backup Power Domain status, whether or not the system is in backup mode.
BU_VIN	0: PD8		Battery input for Backup Power Domain.
BU_VOUT	0: PE2		Power output for Backup Power Domain.
CAN0_RX	0: PC0 1: PF0 2: PD0 3: PB9	5: PD14 6: PE0	CAN0 RX.

Certain alternate function locations may have non-interference priority. These locations will take precedence over any other functions selected on that pin (i.e. another alternate function enabled to the same pin inadvertently).

Some alternate functions may also have high speed priority on certain locations. These locations ensure the fastest possible paths to the pins for timing-critical signals.

The following table lists the alternate functions and locations with special priority.

### 5.22 Analog Port (APORT) Client Maps

The Analog Port (APORT) is an infrastructure used to connect chip pins with on-chip analog clients such as analog comparators, ADCs, DACs, etc. The APORT consists of a set of shared buses, switches, and control logic needed to configurably implement the signal routing. Figure 5.20 APORT Connection Diagram on page 204 shows the APORT routing for this device family (note that available features may vary by part number). A complete description of APORT functionality can be found in the Reference Manual.

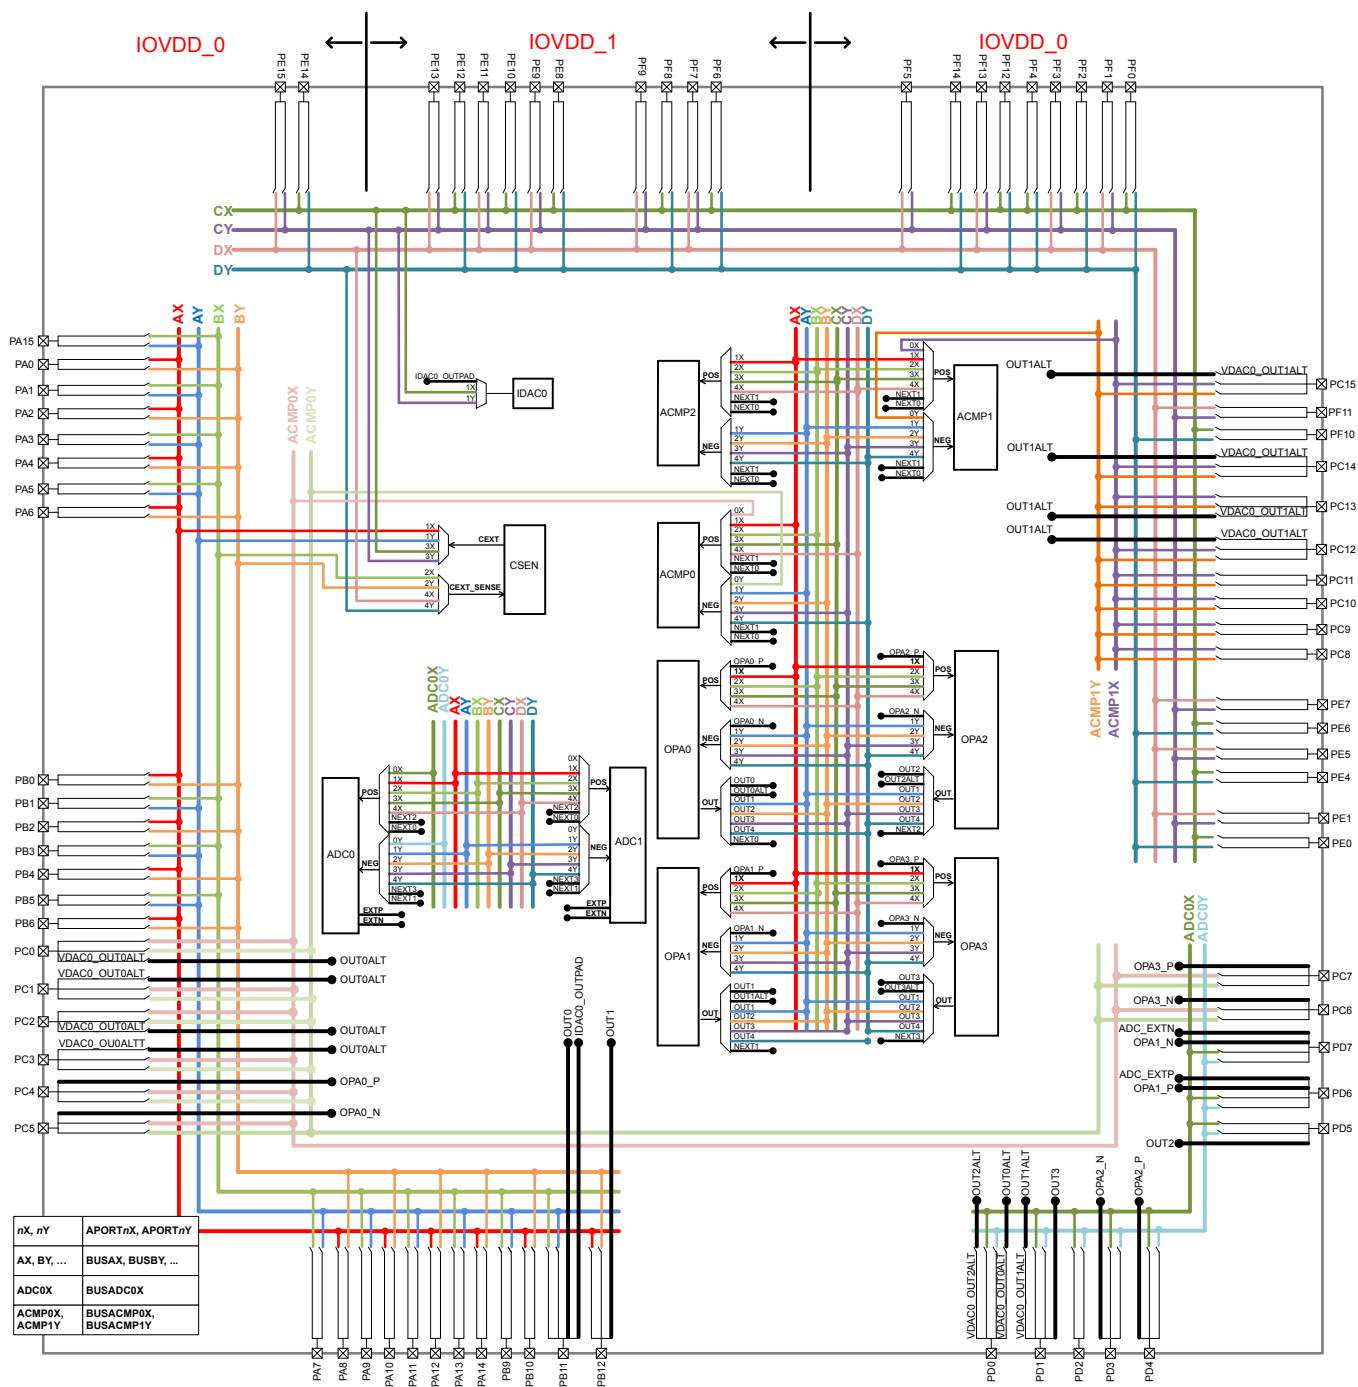

Figure 5.20. APORT Connection Diagram

Client maps for each analog circuit using the APORT are shown in the following tables. The maps are organized by bus, and show the peripheral's port connection, the shared bus, and the connection from specific bus channel numbers to GPIO pins.

In general, enumerations for the pin selection field in an analog peripheral's register can be determined by finding the desired pin connection in the table and then combining the value in the Port column (APORT\_\_), and the channel identifier (CH\_\_). For example, if pin

PF7 is available on port APORT2X as CH23, the register field enumeration to connect to PF7 would be APORT2XCH23. The shared bus used by this connection is indicated in the Bus column.

**Note:**

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing is per the ANSI Y14.5M-1994 specification.
3. This Land Pattern Design is based on the IPC-7351 guidelines.
4. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60  $\mu$ m minimum, all the way around the pad.
5. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
6. The stencil thickness should be 0.125 mm (5 mils).
7. The ratio of stencil aperture to land pad size should be 1:1.
8. A No-Clean, Type-3 solder paste is recommended.
9. The recommended card reflow profile is per the JEDEC/IPC J-STD-020C specification for Small Body Components.

### 6.3 BGA120 Package Marking

The package marking consists of:

- PPPPPPPPPP – The part number designation.
- TTTTTT – A trace or manufacturing code. The first letter is the device revision.
- YY – The last 2 digits of the assembly year.
- WW – The 2-digit workweek when the device was assembled.

## 11. Revision History

### Revision 1.0

July, 2019

- [4.1 Electrical Characteristics](#) updated with final production test limits.
- RESETn pin pullup connection to AVDD clarified in pinout tables.
- [Table 5.20 GPIO Functionality Table on page 166](#) formatting updated for translation.

### Revision 0.6

February, 2019

- Updated [2. Ordering Information](#) with new high temperature range BGA part numbers.
- [4.1 Electrical Characteristics](#) updated with notes distinguishing RESETn reference (AVDD) from all other GPIO reference (IOVDD).
- Added to pin description of DECOUPLE - decouple output for on-chip voltage should not be used to power external circuits.
- [5.20 GPIO Functionality Table](#): re-ordered to show pins in alphabetical order by GPIO name.

### Revision 0.5

December, 2018

- [4.1 Electrical Characteristics](#) updated with latest characterization data and production test limits.
- [4.1 Electrical Characteristics](#) added SDIO location 1 and SDIO SPI mode timing details.
- [4.1 Electrical Characteristics](#) sorted all table footnotes in order of appearance.
- [Table 5.21 Alternate Functionality Overview on page 178](#) changed vertical white space.

### Revision 0.1

May, 2018

Initial release.

### Disclaimer

Silicon Labs intends to provide customers with the latest, accurate, and in-depth documentation of all peripherals and modules available for system and software implementers using or intending to use the Silicon Labs products. Characterization data, available modules and peripherals, memory sizes and memory addresses refer to each specific device, and "Typical" parameters provided can and do vary in different applications. Application examples described herein are for illustrative purposes only. Silicon Labs reserves the right to make changes without further notice to the product information, specifications, and descriptions herein, and does not give warranties as to the accuracy or completeness of the included information. Without prior notification, Silicon Labs may update product firmware during the manufacturing process for security or reliability reasons. Such changes will not alter the specifications or the performance of the product. Silicon Labs shall have no liability for the consequences of use of the information supplied in this document. This document does not imply or expressly grant any license to design or fabricate any integrated circuits. The products are not designed or authorized to be used within any FDA Class III devices, applications for which FDA premarket approval is required or Life Support Systems without the specific written consent of Silicon Labs. A "Life Support System" is any product or system intended to support or sustain life and/or health, which, if it fails, can be reasonably expected to result in significant personal injury or death. Silicon Labs products are not designed or authorized for military applications. Silicon Labs products shall under no circumstances be used in weapons of mass destruction including (but not limited to) nuclear, biological or chemical weapons, or missiles capable of delivering such weapons. Silicon Labs disclaims all express and implied warranties and shall not be responsible or liable for any injuries or damages related to use of a Silicon Labs product in such unauthorized applications.
