Product Specification

PE42452

UltraCMOS® SP5T RF Switch
450–4000 MHz

Features

- Five symmetric, absorptive RF ports
- High isolation
  - 61 dB @ 900 MHz
  - 55 dB @ 2100 MHz
  - 52 dB @ 2700 MHz
  - 44 dB @ 4000 MHz
- High linearity
  - IIP2 of 96 dBm
  - IIP3 of 57 dBm
- 1.8V control logic compatible
- 105°C operating temperature
- Fast switching time of 265 ns
- Three pin CMOS logic control
- External negative supply option
- ESD performance
  - 4kV HBM on RF pins to GND
  - 1.5kV HBM on all pins

Product Description

The PE42452 is a HaRP™ technology-enhanced absorptive SP5T RF switch designed for use in 3G/4G wireless infrastructure and other high performance RF applications.

This switch is a pin-compatible upgraded version of the PE42451 with 1.8V control logic. It is comprised of five symmetric RF ports and has very high isolation. An integrated CMOS decoder facilitates a three-pin low voltage CMOS control interface and an external negative supply option. In addition, no external blocking capacitors are required if 0V DC is present on the RF ports.

The PE42452 is manufactured on Peregrine's UltraCMOS® process, a patented variation of silicon-on-insulator (SOI) technology on a sapphire substrate.

Peregrine's HaRP™ technology enhancements deliver high linearity and excellent harmonics performance. It is an innovative feature of the UltraCMOS® process, offering the performance of GaAs with the economy and integration of conventional CMOS.

20	Vss_{EXT}[2]	External Vss negative voltage control/ ground
22	RFC[1]	RF common
Pad	GND	Exposed pad: Ground for proper operation

Notes: 1. RF pins 2, 5, 8, 11, 14, and 22 must be at 0V DC. The RF pins do not require DC blocking capacitors for proper operation if the 0V DC requirement is met
2. Use Vss_{EXT} (pin 20, refer to *Table 3*) to bypass and disable internal negative voltage generator. Connect Vss_{EXT} (pin 20, Vss_{EXT} = GND) to enable internal negative voltage generator

Notes: 1. Human Body Model (MIL_STD 883 Method 3015)
2. Machine Model (JEDEC JESD22-A115)
3. Charged Device Model (JEDEC JESD22-C101D)

Exceeding absolute maximum ratings may cause permanent damage. Operation should be restricted to the limits in the Operating Ranges table. Operation between operating range maximum and absolute maximum for extended periods may reduce reliability.

Electrostatic Discharge (ESD) Precautions

When handling this UltraCMOS® device, observe the same precautions that you would use with other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the rating specified.

Latch-Up Avoidance

Unlike conventional CMOS devices, UltraCMOS® devices are immune to latch-up.

Switching Frequency

The PE42452 has a maximum 25 kHz switching rate in normal mode (pin 20 = GND). A faster switching rate is available in bypass mode (pin 20 = Vss_{EXT}). The rate at which the PE42452 can be switched is then limited to the switching time as specified in *Table 1*.

Switching frequency describes the time duration between switching events. Switching time is the time duration between the point the control signal reaches 50% of the final value and the point the output signal reaches within 10% or 90% of its target value.

Moisture Sensitivity Level

The Moisture Sensitivity Level rating for the PE42452 in the 24-lead 4x4 QFN package is MSL1.

Table 5. Truth Table

Mode	V3	V2	V1
All off	0	0	0
RF1 on	0	0	1
RF2 on	0	1	0
RF3 on	0	1	1
RF4 on	1	0	0
RF5 on	1	0	1
All off	1	1	0
Unsupported	1	1	1

Note: Logic State 111 is unsupported and should not be used under any operating conditions

Optional External Vss Control (VssEXT)

For applications the require a faster switching rate or spur-free performance, this part can be operated in bypass mode. Bypass mode requires an external negative voltage in addition to an external V_{DD} supply voltage.

As specified in *Table 3*, the external negative voltage (Vss_{EXT}) when applied to pin 20 will disable and bypass the internal negative voltage generator.

Spurious Performance

The typical low-frequency spurious performance of the PE42452 in normal mode is –120 dBm (pin 20 = GND). If spur-free performance is desired, the internal negative voltage generator can be disabled by applying a negative voltage to Vss_{EXT} (pin 20).

Evaluation Kit

The SP5T switch Evaluation Board was designed to ease customer evaluation of Peregrine's PE42452. The RF common port is connected through a 50Ω transmission line via the top SMA connector. RF1, RF2, RF3, RF4 and RF5 are connected through 50Ω transmission lines via side SMA connectors. A through 50Ω transmission is available via SMA connectors RFCAL1 and RFCAL2. This transmission line can be used to estimate the loss of the PCB over the environmental conditions being evaluated.

The EVK board is constructed with four metal layers on dielectric materials of Rogers 4003C and 4450 with a total thickness of 32 mils. Layer 1 and layer 3 provide ground for the 50Ω transmission lines. The 50Ω transmission lines are designed in layer 2 for high isolation purpose and use a stripline waveguide design with a trace width of 9.4 mils and trace metal thickness of 1.8 mils. The board stack up for 50 ohm transmission lines has 8 mil thickness of Rogers 4003C between layer 1 and layer 2, and 10 mil thickness of Rogers 4450 between layer 2 and layer 3. Please consult manufacturer's guidelines for proper board material properties in your application. The PCB should be designed in such a way that RF transmission lines and sensitive DC I/O traces such as Vss_{EXT} are heavily isolated from one another, otherwise the true performance of the PE42452 will not be yielded.
