

## DESCRIPTION

The EV20045DQ-00A evaluation board demonstrates the performance of MP20045, a low noise, low dropout and high PSRR linear regulator. It operates from a 2.5V to 5.5V input voltage and the output voltage can be set externally which ranges from 1.5V to 5V.

The EV20045DQ-00A can supply up to 1A of load current, and features current limiting, over temperature protection and power-good status.

An internal PMOS pass element is used to allow a low 110uA ground current, marking the MP20045 suitable for battery-power devices.

## ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V <sub>IN</sub>	3.5 – 5.5	V
Output Voltage	V <sub>OUT</sub>	3	V
Load Current	I <sub>OUT</sub>	1	A

## FEATURES

- Up to 1A Output Current
- Low 140mV Dropout at 1A
- Adjustable Output
- 56dB PSRR at 1kHz
- 13μV<sub>RMS</sub> Low Noise Output
- Open Drain Power-Good Status Output
- Very Fast Transient Responses
- Current Limit and Thermal Protection

## APPLICATIONS

- Notebook Computers
- Cordless Telephones
- Cellular Phones
- Modems
- Hand-Held Instruments
- PDA and Palmtop Computers

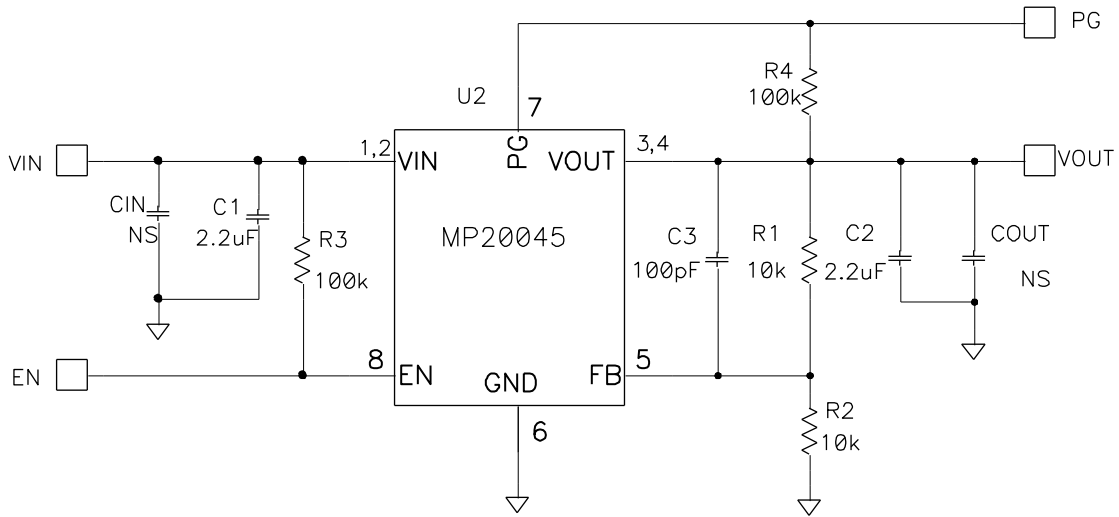

MPS® and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

## QUICK START GUIDE (ADJUSTABLE OUTPUT)

The output voltage of this board is set externally which ranges from 1.5V to 5V by operating from +2.5V to +5.5V input as the figure 4. The default output voltage of this board is set to 3.0V.

The board layout accommodates most commonly used resistors and capacitors.

1. Attach the positive and negative ends of the load to the V<sub>OUT</sub> and GND pins, respectively.
2. Attach the Input Voltage ( $3.5V \leq V_{IN} \leq 5.5V$ ) and Input Ground to the VIN and GND pins, respectively.
3. To enable the MP20045 apply a voltage,  $1.5V \leq V_{EN} \leq 5.5V$ , to the EN pin. To disable the MP20045 apply a voltage,  $V_{EN} < 0.4V$ , to the EN pin. The EN pin can be connected to V<sub>IN</sub> with a 100kΩ resistor for automatic startup.
4. The Output Voltage V<sub>OUT</sub> can be changed by varying R2. Calculate the new value by formula:

$$R2 = \frac{R1}{\left(\frac{V_{OUT}}{V_{FB}}\right) - 1}$$

Where V<sub>FB</sub> = 1.5V and R1 = 10kΩ.

Example:

For V<sub>OUT</sub> = 3.0V:

$$R2 = \frac{10k\Omega}{\left(\frac{3.0}{1.5}\right) - 1} = 10k\Omega$$

Therefore, use a 10kΩ standard 1% value.
