

# EV2639C-R-00A

## Reference Design for MP2639C, 2- Cell Li-ion or Li-polymer Switching Charger with 5V input Integrated Bidirectional Charge/Discharge

### DESCRIPTION

The EV2639C-R-00A is the reference design board for MP2639C, a highly-integrated, flexible switch-mode battery charge management for 2-cell series Li-ion and Li-Polymer battery used in a wide range of applications.

The demo board uses two operating modes—charge mode and discharge mode—to allow management of system and battery power based on the state of the input.

When input power is present, the board charges a 2-cell series battery with 2.5A charge current.

In the absence of an input source, the board switches to discharge mode through the PB pin to power the system from the battery with 5A.

The evaluation board provides 4-LED drivers to achieve the voltage based fuel gauge indication and distinguish charge mode from discharge mode.

To guarantee safe operation, the EV2639C-R-00A has input-over-voltage protection, battery over-voltage protection, thermal shutdown, battery-temperature monitoring, and a charge timer to prevent prolonged charging a dead battery.

### ELECTRICAL SPECIFICATION

Parameter	Symbol	Value	Units
<b>Charge Mode</b>			
Input Voltage Range	$V_{IN}$	4 – 5.75	V
Charge-Full Voltage	$V_{BATT\_Full}$	8.4	V
Charge Current	$I_{CHG}$	2.5	A
Input Current Limit	$I_{IN\_LIM}$	2.7	A
<b>Discharge Mode</b>			
Battery Voltage	$V_{BATT}$	5.75-8.4	V
Output Voltage Regulation	$V_{OUT}$	5	V
Output Current Limit	$I_{OUT}$	5	A

### FEATURES

- 4V-to-5.75V Operating Input Voltage Range
- Charge 2-cell Battery With 5V Input
- Power Management Function Integrated Input-Current-Limit and Input Voltage Regulation
- 2.5A Charge Current
- 8.4V Charge Voltage with 0.5% Accuracy
- Battery Temperature Monitoring
- 4-LED drivers for battery fuel gauge indication
- Charge Timer Back-Up Protection
- Battery-Reverse-Leakage Blocking
- Reverse-Buck Operation for Powering System
- 92.5% 5V discharge Mode Efficiency @ 5A with BATT=8.4V
- 5A Output Current Limit in discharge Mode

### APPLICATIONS

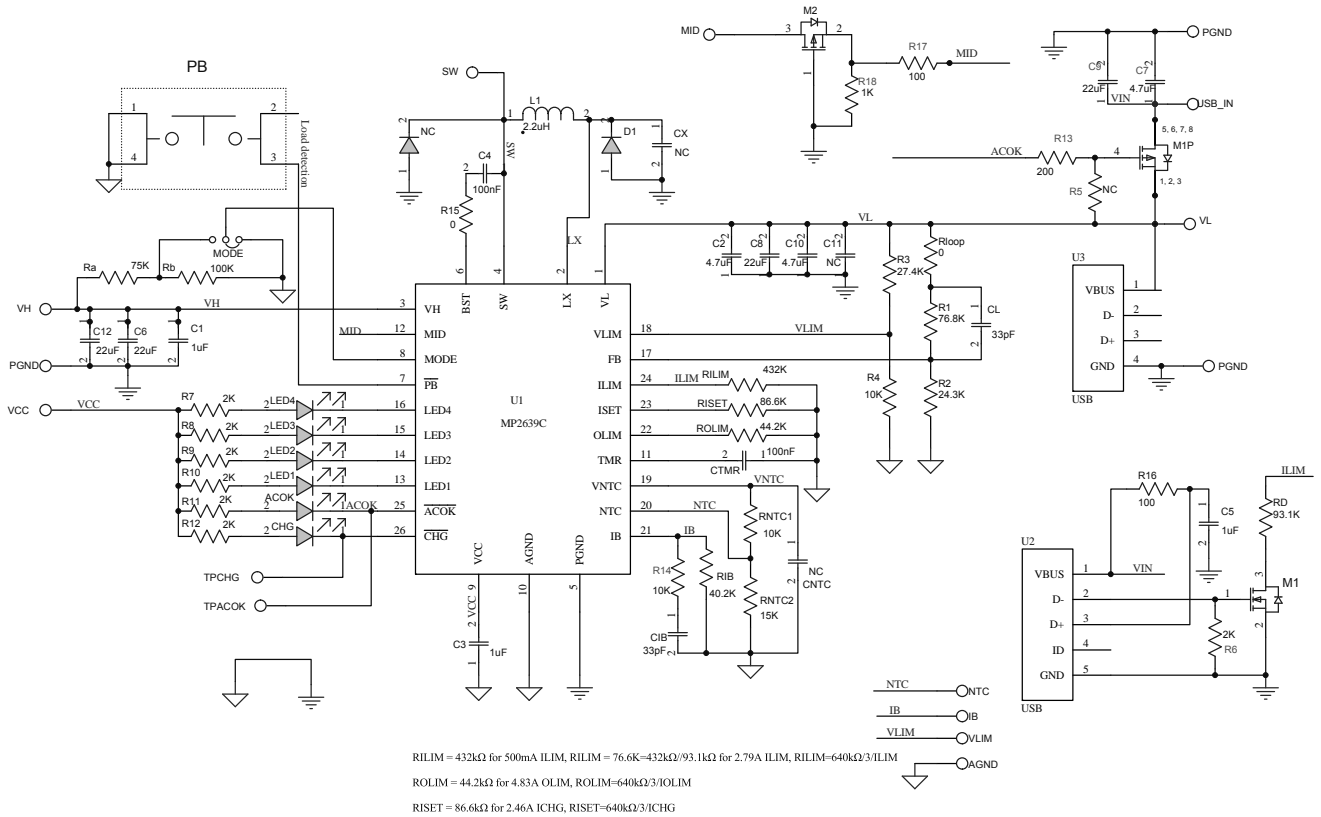

- Sub-battery Applications
- Power-bank Applications for Smart-Phone, Tablet and Other Portable Devices

All MPS parts are lead-free, halogen free, and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance.

"MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

## PRINTED CIRCUIT BOARD LAYOUT

Figure1: Top Layer

Figure 2: Bottom Layer

## QUICK START GUIDE

This demo board is reference design for MP2639C, flexible switch-mode battery charging management device for 2-cell series Li-ion and Li-Polymer battery pack used in a wide range of portable applications through the boost converter from VL to VH. This part could also works in discharging mode which could discharge the 2 cell battery to the load, from VH to VL.

The board's layout accommodates most commonly-used capacitors. The default function of this board is preset at charge mode, and the charge full voltage is preset to 8.4V for a 2-cell series Li-Ion battery.

### Charge Mode Setting

#### 1. Input Current Limit

The input current limit can be set slightly below the input source's maximum current rating. When the input current hits this limit, the charge current could decrease to keep the input current constant at the limit value to initially power the system.  $R_{ILIM}$ —the resistor connected to the ILIM pin—programs this limit. To set the input current limit at 2.7A, use an  $R_{ILIM}$  of 79k $\Omega$ .

$$I_{INLIMIT} = \frac{640k}{3 \times R_{ILIM}} \quad (1)$$

#### 2. Charge Current

The charge current can be programmed via  $R_{ISET}$ . Determine the charge current using the following formula:

$$I_{CHG} = \frac{640k}{3 \times R_{ISET}} \quad (2)$$

For 2.5A charge current, the given  $R_{ISET}$  is 85.3k $\Omega$ .

#### 3. Input Voltage Limit

The input voltage clamp threshold can programmable by the VLIM pin. The internal reference of the input voltage loop is 1.2V, so the input voltage clamp limit would be,

$$V_{INLIMIT} = 1.2 \times \frac{R_3 + R_4}{R_4} \quad (3)$$

Here,  $R_3=27.4k\Omega$ ,  $R_4=10k\Omega$ , the input voltage clamp value is 4.49V.

### Discharge Mode Setting

#### 1. System-Output-Current Limit

Set the system-output-current limit in buck mode for the EV2639C to operate like a standard adapter. Set the output current limit as per the following equation:

$$I_{OLIM} = \frac{640k}{3 \times R_{OLIM}} \quad (4)$$

For 5A output current limit, the given  $R_{OLIM}$  is 42.6k $\Omega$ .

## EQUIPMENT REQUIREMENT

Evaluation requires the following equipments:

1. For the charge input, USB cable with an adaptor or any USB port with load capability can be directly used for the reference design board. In case some operation state can't be tested, external wire can be added to connect a power source with 6V/3A capability.
2. Battery simulator or 2-cell battery pack. The battery simulator's output rating should exceed 9V/7.0A. When using a real battery pack, please observe all precautions on the battery manufacturer's data sheet first and ensure the charger's setting doesn't exceed the battery's absolute maximum specifications.
3. E-load or real smart phone. The E-load capability should exceed 5V/5A.
4. An oscilloscope. A single voltage probe and a single current probe.
5. Multi-meter.

### Charge Function

- 1 Attach the positive(VH) and negative ends(PGND) of the board to the "+" and "-" terminals of the battery or battery simulator, respectively. If it's a battery simulator, please preset the voltage to 7.6V (typical value for 2-cell) first.
- 2 Connect Mode pin to L for Charge mode selection.
- 3 Present the DC source or the USB cable with 5V output.

Figure 3: Setup for Charge Mode from DC source

Figure 4: Setup for Charge Mode from USB cable

- 4 Turn on DC source or connect the adaptor or USB port to the demo board, the charge starts. Use the oscilloscope to verify that the charge current is being delivered to the battery, the charge current could be a different value under following conditions:

- a. The charge current could be limited by input current limit.

The IC features the input source detection to decide the input current limit according to the input source (USB or adaptor). The IC sets the input current limit through the ILIM pin. When the input current hits this limit and battery voltage continue to increase, the charge current could decrease to keep the input current constant at the limit value.

- b. The charge current could be limited by the input voltage regulation.

If the input power supply has lower current capability (such as USB port with 500mA only) than the setting input current limit or the voltage drop on USB cable is too big, the input voltage may approach the input voltage regulation threshold (4.49V) preset by R3 and R4. Once the input voltage approaches the input voltage regulation threshold, charge current is reduced to allow priority of system power and maintain the input voltage avoid dropping further.
