

DESCRIPTION

The MP3378 is a one-chip solution, specially designed for monitor applications, which includes a step-up controller with 4 current channels for backlight and a high efficiency buck converter for internal bus voltage or standby power.

The 4-string WLED controller drives an external MOSFET to boost up the output voltage from the input supply. It regulates the current in each LED string to the programmed value set by an external current setting resistor. It can support both analog and PWM dimming independently to meet the special dimming mode request. In addition, rich protection modes are also integrated including OCP, OTP, UVP, OVP, LED short/open protection, inductor/diode short protection.

The high efficiency buck converter operates in the current mode operation with built in MOSFET and synchronous rectifier. It offers a very compact solution to achieve excellent load and line regulation. Full protection features include OCP and thermal shut down.

The MP3378 is available in SOIC28 package.

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	8– 24	V
LEDs #		4 LED strings 10 LEDs/string	
LED Current	I_{LED}	120/string	mA
I_{OUT} Current (buck)	I_{OUT}	2	A

FEATURES

WLED Controller:

- 4-String, Max 350mA/String WLED Controller
- Up to 24V Input Voltage Range
- 2.5% Current Matching Accuracy
- Programmable Switching Frequency
- PWM and Analog Dimming Mode
- LED Open and Short LED Protection
- Programmable Over-Voltage Protection
- Recoverable thermal Shutdown Protection
- Over Current Protection
- Over Temperature Protection
- Inductor/Diode short Protection

Buck Converter:

- 90mΩ/40mΩ Low Rds(on) Internal Power MOSFETs
- Low Quiescent Current
- Fixed 235kHz Switching Frequency
- Frequency Sync from 250kHz to 2MHz External Clock
- AAM Power Save Mode
- Internal Soft Start
- OCP Protection and Hiccup
- Over Temperature Protection
- Output Adjustable from 0.8V

APPLICATIONS

- LCD Monitors

All MPS parts are lead-free, halogen free, and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance.

“MPS” and “The Future of Analog IC Technology” are Registered Trademarks of Monolithic Power Systems, Inc.

EVB TEST RESULTS

Performance waveforms are tested on the evaluation board.

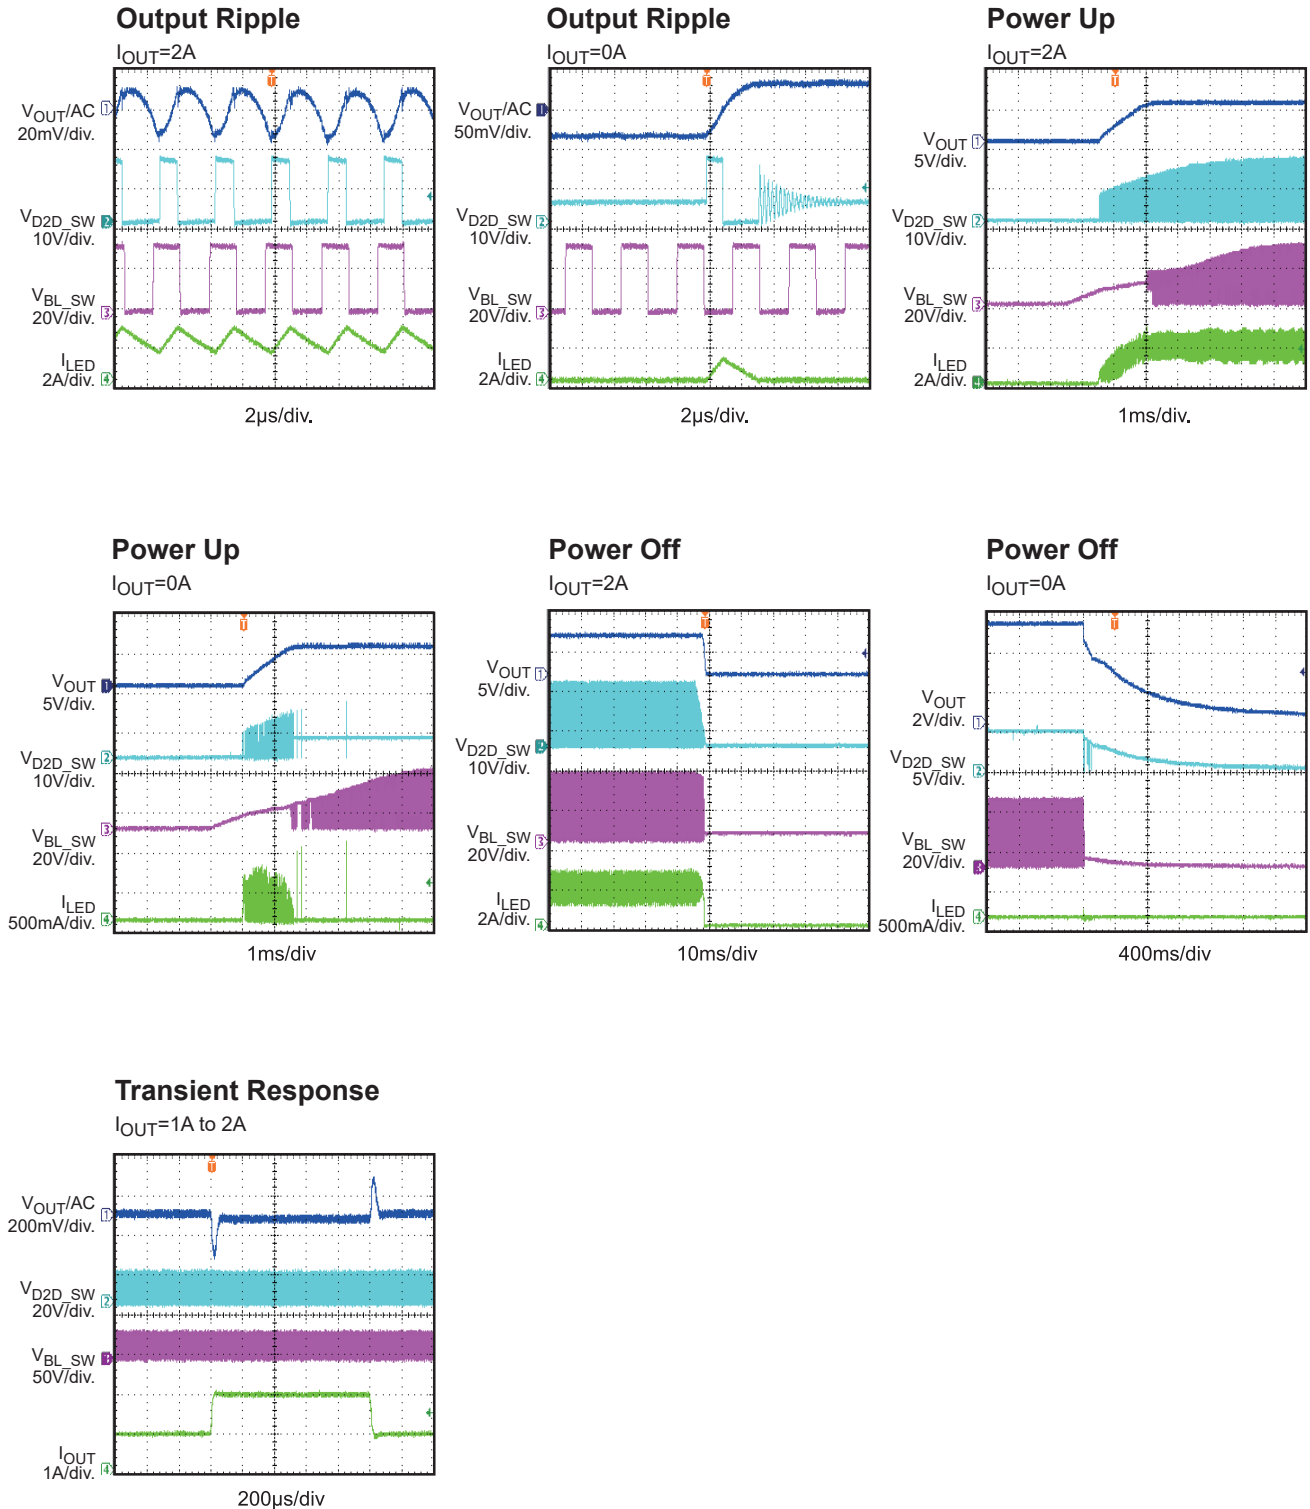

VIN = 16V, 10 LEDs in series, 4 strings parallel, 120mA/string, TA = 25°C, unless otherwise noted.

EVB TEST RESULTS *(continued)*

Performance waveforms are tested on the evaluation board.

$V_{IN} = 16V$, 10 LEDs in series, 4 strings parallel, 120mA/string, $T_A = 25^\circ C$, unless otherwise noted.

QUICK START GUIDE

1. For Boost LED Controller, connect the positive and negative terminals of the load panel (10 white LEDs in series, 4 strings) to the LED and LED1~4 pins on the EV board, respectively.

For Buck Converter, connect the load between Vout to GND.

2. Connect the positive and negative terminals of the power supply (8V ~ 24V) to the VIN and GND pins on the EV board, respectively. Then the Buck Converter will work.
3. Pull both PWM and A-DIM pin to high level (1.5-5V).
4. Pull EN/BL pin high (1.5-5V) to enable the Boost LED Controller.
5. For PWM dimming, apply a PWM rectangular waveform with a minimum voltage less than 0.4V and a maximum greater than 1.5V on PWM pin. The LED current is chopped by PWM signal. The frequency of the PWM signal is recommended between 200Hz to 2kHz.
6. For analog dimming, apply a DC waveform with a voltage between 0.4 and 1.5V on A-DIM pin; or a PWM rectangular waveform with a minimum voltage less than 0.4V and a maximum greater than 1.5V on A-DIM pin, the frequency of the PWM signal is recommended ≥ 20 kHz. The amplitude of LED current linearly follows the voltage of A-DIM or the duty of the PWM signal.
