EV6605C-R-00A
4-Channel Low-Side Driver with I²C Interface Evaluation Board

DESCRIPTION

The EV6605C-R-00A evaluation board is designed to demonstrate the capabilities of the MP6605C, a 4-channel low-side (LS) driver with an I²C interface. It integrates low-side MOSFETs (LS-FETs) and high-side (HS) clamp diodes to drive inductive loads.

The MP6605C operates from a supply voltage up to 60V, and can deliver output current (I_{OUT}) up to 1.5A. The MP6605C supports a 3.3V and

5V logic supply. Internal safety features include over-current protection (OCP), under-voltage lockout (UVLO), and over-temperature (OT) shutdown.

The MP6605C is typically used for unipolar stepper motors and solenoid drivers. The MP6605C is available in a QFN-24 (4mmx4mm) package.

PERFORMANCE SUMMARY

Specifications are at T_A = 25°C, unless otherwise noted.

| Parameters	Conditions	Value
Supply voltage range (V_{IN})	24V TVS diode connected between VIN and VCLAMP	4.5V to 30V
	VCLAMP connected to VIN	4.5V to 60V
High-side (HS) clamp voltage (V_{CLAMP})		≤60V
Maximum low-side (LS) output current (I_{OUT_LS})	For LS-FETs	1.5A
Maximum HS output current (I_{OUT_HS})	For HS diodes	1.5A at duty cycle < 20%

QUICK START GUIDE

1. Preset the logic power supply voltage (typically 3.3V or 5V).

2. To preset the input power supply voltage, follow the steps below:

    a. Connect the 24V TVS diode between the VIN and VCLAMP pins (where V_{IN} is between 4.5V and 30V).

    b. Connect VCLAMP to VIN (where V_{IN} is between 4.5V and 60V).

3. Connect the I²C communication interface to CN1.

4. Connect the loads to the OUTx terminals.

5. Connect the logic power supply terminals to:

    a. Positive (+): VCC

    b. Negative (-): GND

6. Connect the input power supply terminals to:

    a. Positive (+): VIN

    b. Negative (-): GND

7. Set the physical device address via S2.

8. LED1 indicates fault events including over-current protection (OCP), under-voltage lockout (UVLO), and over-temperature (OT) shutdown.

    Figure 1 shows the measurement equipment set-up.
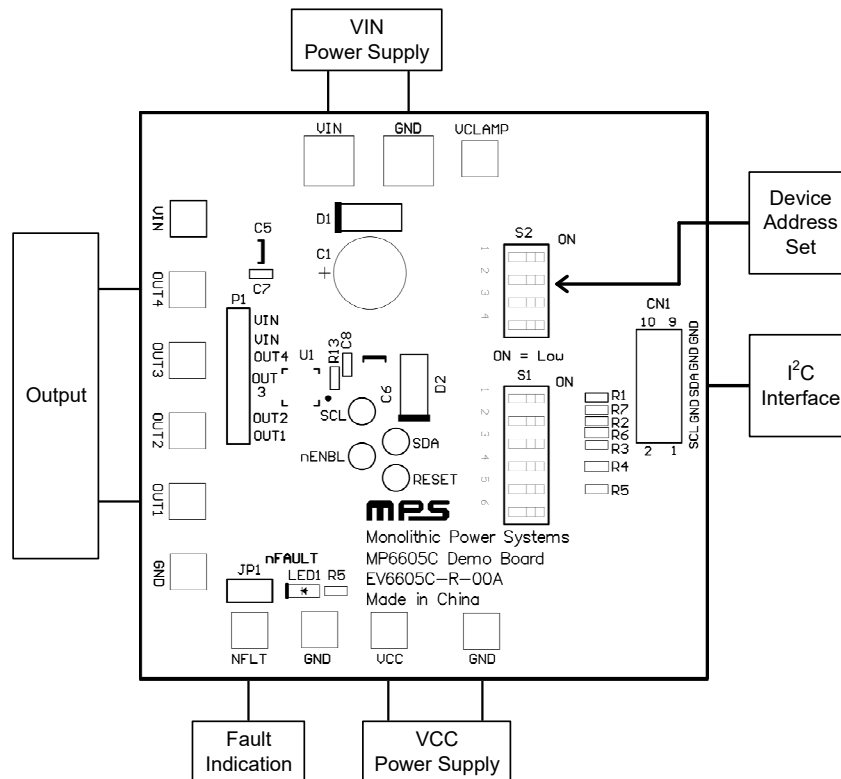

Figure 1: Measurement Equipment Test Set-Up

GUI OPERATION

To configure the device using the graphic user interface (GUI), refer to Figure 2 and follow the steps below:

1. Set the address byte. The first 3 bits are fixed to 010, the following 4 bits are the address bits, and the last bit is a read/write (R/W) bit.

2. Set the data byte. The first 4 bits are read-only, and the following 4 bits can be used to control the four LS-FETs or read their statuses.

3. Click "Write" or "Loop Write" to write the data (address byte and data byte). If the R/W bit is set to 1, then "Write" and "Loop Write" change to "Read" and "Loop Read," respectively.

Address

			A3	A2	A1	A0	RW	Value	
0	1	0	0	0	0	0	0	0x00	Write

Data

X	S2	S1	S0	D3	D2	D1	D0	Value	
0	0	0	0	0	0	0	0	0x00	Loop Write

EVB TEST RESULTS

V_{IN} = 12V, V_{CLAMP} = 24V TVS to V_{IN}, T_A = 25°C, resistor + inductor load: R = 33Ω, L = 1.5mH per channel, unless otherwise noted.
Normal Operation
f_{SW} = 1kHz
Start-Up through VIN
Shutdown through VIN
