

FEATURES

Latch-up immune under all circumstances
 Human body model (HBM) ESD rating: 8 kV
 Low on resistance: 13.5 Ω
 ± 9 V to ± 22 V dual-supply operation
 9 V to 40 V single-supply operation
 48 V supply maximum ratings
 Fully specified at ± 15 V, ± 20 V, +12 V, and +36 V
 V_{DD} to V_{SS} analog signal range

APPLICATIONS

High voltage signal routing
 Automatic test equipment
 Analog front-end circuits
 Precision data acquisition
 Industrial instrumentation
 Amplifier gain select
 Relay replacement

GENERAL DESCRIPTION

The **ADG5419** is a monolithic industrial, complementary metal oxide semiconductor (CMOS) analog switch containing a latch-up immune single-pole/double-throw (SPDT) switch.

Each switch conducts equally well in both directions when on, and each switch has an input signal range that extends to the power supplies. In the off condition, signal levels up to the supplies are blocked. The **ADG5419** exhibits break-before-make switching action for use in multiplexer applications.

The ultralow on resistance and on-resistance flatness of these switches make them ideal solutions for data acquisition and gain switching applications where low distortion is critical. The latch-up immune construction and high ESD rating make these switches more robust in harsh environments.

FUNCTIONAL BLOCK DIAGRAMS

Figure 1. 8-Lead LFCSP

Figure 2. 8-Lead MSOP

PRODUCT HIGHLIGHTS

1. Trench isolation guards against latch-up. A dielectric trench separates the P channel and N channel transistors, thereby preventing latch-up even under severe overvoltage conditions.
2. Low R_{ON} of 13.5 Ω .
3. Dual-supply operation. For applications where the analog signal is bipolar, the **ADG5419** can be operated from dual supplies up to ± 22 V.
4. Single-supply operation. For applications where the analog signal is unipolar, the **ADG5419** can be operated from a single-rail power supply up to 40 V.
5. 3 V logic compatible digital inputs: $V_{INH} = 2.0$ V, $V_{INL} = 0.8$ V.
6. No V_I logic power supply required.
7. Available in 8-lead MSOP and 8-lead, 2 mm \times 3 mm LFCSP packages.

$V_{DD} = 12\text{ V}, V_{SS} = 0\text{ V}$	126	78	48	mA maximum	
$V_{DD} = 36\text{ V}, V_{SS} = 0\text{ V}$	160	93	53	mA maximum	

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 6.

Parameter	Rating
V_{DD} to V_{SS}	48 V
V_{DD} to GND	-0.3 V to +48 V
V_{SS} to GND	+0.3 V to -48 V
Analog Inputs ¹	$V_{SS} - 0.3\text{ V}$ to $V_{DD} + 0.3\text{ V}$ or 30 mA, whichever occurs first
Digital Inputs ¹	$V_{SS} - 0.3\text{ V}$ to $V_{DD} + 0.3\text{ V}$ or 30 mA, whichever occurs first
Peak Current, Sx or D Pins	410 mA (pulsed at 1 ms, 10% duty cycle maximum)
Continuous Current, Sx or D ²	Data + 15%
Temperature Range	
Operating	-40°C to +125°C
Storage	-65°C to +150°C
Junction Temperature	150°C
Thermal Impedance, θ_{JA}	
8-Lead MSOP (4-Layer Board)	133.1°C/W
8-Lead LFCSP	60.88°C/W
Reflow Soldering Peak Temperature, Pb Free	As per JEDEC J-STD-020
Human Body Model (HBM) ESD	8 kV

¹ Overvoltages at the IN, Sx, and D pins are clamped by internal diodes. Limit current to the maximum ratings given.

² See Table 5.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

NOTES
1. EXPOSED PAD TIED TO SUBSTRATE, V_{SS} .

Figure 3. 8-Lead LFCSP Pin Configuration

11370-103

NOTES
1. NC = NO CONNECT. NOT INTERNALLY CONNECTED.

Figure 4. 8-Lead MSOP Pin Configuration

11370-002

Table 7. Pin Function Descriptions

Pin No.		Mnemonic	Description
LFCSP	MSOP		
1	1	D	Drain Terminal. This pin can be an input or output.
2	2	SA	Source Terminal. This pin can be an input or an output.
3	3	GND	Ground (0 V) Reference.
4	4	V_{DD}	Most Positive Power Supply Potential.
5		EN	Active High Digital Input. When this pin is low, the device is disabled and all switches are turned off. When this pin is high, the IN logic input determines the state of the switch.
6	6	IN	Logic Control Input.
7	7	V_{SS}	Most Negative Power Supply Potential.
8	8	SB	Source Terminal. This pin can be an input or an output.
	5	NC	No Connect. Not internally connected.
	Not applicable	EPAD	Exposed Pad. Exposed pad tied to substrate, V_{SS} .

Table 8. LFCSP Truth Table

EN	IN	Switch A	Switch B
0	X ¹	Off	Off
1	0	On	Off
1	1	Off	On

¹X = don't care.

TERMINOLOGY

I_{DD}

I_{DD} represents the positive supply current.

I_{SS}

I_{SS} represents the negative supply current.

V_D, V_S

V_D and V_S represent the analog voltage on Terminal D and Terminal S, respectively.

R_{ON}

R_{ON} is the ohmic resistance between Terminal D and Terminal S.

ΔR_{ON}

ΔR_{ON} represents the difference between the R_{ON} of any two channels.

$R_{FLAT(ON)}$

The difference between the maximum and minimum value of on resistance as measured over the specified analog signal range is represented by $R_{FLAT(ON)}$.

I_S (Off)

I_S (Off) is the source leakage current with the switch off.

I_D (Off)

I_D (Off) is the drain leakage current with the switch off.

I_D (On), I_S (On)

I_D (On) and I_S (On) represent the channel leakage currents with the switch on.

V_{INL}

V_{INL} is the maximum input voltage for Logic 0.

V_{INH}

V_{INH} is the minimum input voltage for Logic 1.

I_{INL}, I_{INH}

I_{INL} and I_{INH} represent the low and high input currents of the digital inputs.

C_D (Off)

C_D (Off) represents the off switch drain capacitance, which is measured with reference to ground.

C_S (Off)

C_S (Off) represents the off switch source capacitance, which is measured with reference to ground.

C_D (On), C_S (On)

C_D (On) and C_S (On) represent on switch capacitances, which are measured with reference to ground.

C_{IN}

C_{IN} represents digital input capacitance.

$t_{ON(EN)}$

$t_{ON(EN)}$ represents the delay time between the 50% and 90% points of the digital input and switch on condition. See Figure 33.

$t_{OFF(EN)}$

$t_{OFF(EN)}$ represents the delay time between the 50% and 90% points of the digital input and switch off condition. See Figure 33.

$t_{TRANSITION}$

$t_{TRANSITION}$ represents the delay time between the 50% and 90% points of the digital inputs and the switch on condition when switching from one address state to another.

t_D

t_D represents the off time measured between the 80% point of both switches when switching from one address state to another.

Off Isolation

Off isolation is a measure of unwanted signal coupling through an off channel.

Charge Injection

Charge injection is a measure of the glitch impulse transferred from the digital input to the analog output during switching.

Crosstalk

Crosstalk is a measure of unwanted signal that is coupled through from one channel to another as a result of parasitic capacitance.

Bandwidth

Bandwidth is the frequency at which the output is attenuated by 3 dB, from its dc level.

Total Harmonic Distortion + Noise (THD + N)

THD + N is the ratio of the harmonic amplitude plus noise of the signal to the fundamental.

AC Power Supply Rejection Ratio (ACPSRR)

ACPSRR measures the ability of a device to avoid coupling noise and spurious signals that appear on the supply voltage pin to the output of the switch. The dc voltage on the device is modulated by a sine wave of 0.62 V p-p. The ratio of the amplitude of signal on the output to the amplitude of the modulation is the ACPSRR. See Figure 23.

APPLICATIONS INFORMATION

The [ADG54xx](#) family of switches and multiplexers provide a robust solution for instrumentation, industrial, aerospace, and other harsh environments that are prone to latch-up, which is an undesirable high current state that can lead to device failure and persists until the power supply is turned off. The [ADG5419](#) high voltage switch allows single-supply operation from 9 V to 40 V and dual-supply operation from ± 9 V to ± 22 V. The [ADG5419](#) (as well as other select devices within this family) achieves an 8 kV human body model ESD rating, which provides a robust solution, eliminating the need for separate protection circuitry designs in some applications.

TRENCH ISOLATION

In the [ADG5419](#), an insulating oxide layer (trench) is placed between the NMOS and the PMOS transistors of each CMOS switch. Parasitic junctions, which occur between the transistors in junction-isolated switches, are eliminated, and the result is a completely latch-up immune switch.

In junction isolation, the N and P wells of the PMOS and NMOS transistors form a diode that is reverse-biased under normal operation. However, during overvoltage conditions, this diode can become forward-biased. The two transistors form a silicon-controlled rectifier (SCR) type circuit, causing a significant amplification of the current that, in turn, leads to latch-up. With trench isolation, this diode is removed, and the result is a latch-up immune switch.

Figure 36. Trench Isolation
