

50 V, 8 MHz, 1.65 mA per Channel, Robust, Over-The-Top, Precision Op Amp

## FEATURES

- ▶ Ultrawide common-mode input range:  $-15.1\text{ V}$  to  $+55\text{ V}$
- ▶ Wide power supply voltage operating range:  $3.15\text{ V}$  to  $50\text{ V}$
- ▶ Low supply current:  $1.65\text{ mA}$  per channel
- ▶ Low input offset voltage:  $\pm 12\text{ }\mu\text{V}$
- ▶ Low offset voltage drift:  $\pm 0.1\text{ }\mu\text{V}/^\circ\text{C}$
- ▶ Low voltage noise
  - ▶  $1/f$  noise corner:  $6\text{ Hz}$
  - ▶  $150\text{ nV p-p}$  at  $0.1\text{ Hz}$  to  $10\text{ Hz}$
  - ▶  $7\text{ nV}/\sqrt{\text{Hz}}$  at  $100\text{ Hz}$  ( $e_n$ )
- ▶ High speed
  - ▶ GBP:  $8\text{ MHz}$
  - ▶ Slew rate:  $5.5\text{ V}/\mu\text{s}$  at  $\Delta V_{\text{OUT}} = 25\text{ V}$
- ▶ Low power supply shutdown current:  $17\text{ }\mu\text{A}$  per channel
- ▶ Low input bias current:  $\pm 4\text{ nA}$
- ▶ Large signal voltage gain:  $154\text{ dB}$  at  $\Delta V_{\text{OUT}} = 25\text{ V}$
- ▶ CMRR:  $130\text{ dB}$  at  $V_{\text{CM}} = -14.75$  to  $+13.25\text{ V}$
- ▶ PSRR:  $136\text{ dB}$
- ▶ Input overdrive tolerant with no phase reversal

## APPLICATIONS

- ▶ Industrial sensor conditioning
- ▶ Supply current sensing
- ▶ Battery and power supply monitoring
- ▶ Front-end amplifiers in abusive environments

## GENERAL DESCRIPTION

The ADA4099-2BCHIPS is a robust, precision, rail-to-rail input and output dual-channel operational amplifier with inputs that operate from  $-V_S$  to  $+V_S$  and beyond, which is referred to in this data sheet as Over-The-Top™. The device features an offset voltage of  $\pm 12\text{ }\mu\text{V}$ , an input bias current ( $I_B$ ) of  $\pm 4\text{ nA}$ , and can operate on supplies that range from  $3.15\text{ V}$  to  $50\text{ V}$ . The ADA4099-2BCHIPS draws  $1.65\text{ mA}$  of supply current per channel.

The ADA4099-2BCHIPS Over-The-Top input stage has robust input protection features for abusive environments. The inputs can tolerate up to  $80\text{ V}$  of differential voltage without damage or degradation to dc accuracy. The operating input common-mode range extends from rail-to-rail and beyond, up to  $70\text{ V} > -V_S$ , independent of the  $+V_S$  supply.

The ADA4099-2BCHIPS is unity-gain stable and can drive loads requiring up to  $20\text{ mA}$  per channel. The device can also drive capacitive loads as large as  $100\text{ pF}$ . The amplifier is available with low power shutdown per channel.

The ADA4099-2BCHIPS is specified at  $+25^\circ\text{C}$  but is functional over the extended industrial temperature range ( $-40^\circ\text{C}$  to  $+125^\circ\text{C}$ ). Additional application and technical information can be found in the [ADA4099-2](#) data sheet.

<sup>1</sup> Thermoelectric voltages present in the high speed production test limit the measurement accuracy of this parameter. The limits listed in Table 1 represent an upper limit imposed by the test capability and are not necessarily indicative of actual performance of the devices.

<sup>2</sup> Offset voltage drift is guaranteed through lab characterization and is not production tested.

<sup>3</sup>  $V_{OD}$  is +30 mV for  $V_{OUT}$  high and -30 mV for  $V_{OUT}$  low.

<sup>4</sup> Maximum operating voltage is limited by the time-dependent dielectric breakdown (TDDb) of on-chip capacitor oxides. The amplifier tolerates temporary transient overshoot up to the specified absolute maximum rating and the dc supply voltage must be limited to the maximum operating voltage.

<sup>5</sup> Thermal shutdown is lab characterized only and is not tested in production.

## ABSOLUTE MAXIMUM RATINGS

**Table 2.**

Parameter	Rating
Supply Voltage <sup>1</sup>	
Transient	60 V
Continuous	50 V
Differential Input Voltage	±80 V
±INx Pin Voltage	
Continuous	-5 V to +80 V
Survival	-10 V to +80 V
±INx Pin Current	20 mA
SHDNx Pin Voltage	-0.3 V to +60 V
Storage Temperature Range	-65°C to +150°C
Functional Temperature Range	-55°C to +150°C
Junction Temperature (T <sub>J</sub> )	175°C

<sup>1</sup> Maximum supply voltage is limited by the TDDB of on-chip capacitor oxides. The amplifier tolerates temporary transient overshoot up to the specified transient maximum rating. The continuous operating supply voltage must be limited to no more than 50 V.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.
