

3.8 Ω On-Resistance, SPDT Switch
FEATURES

- ▶ 3.8 Ω on resistance
- ▶ Specified at
 - ▶ $V_{DD} = +5\text{ V} \pm 10\%$
 - ▶ $V_{SS} = -4.5\text{ V to } -8.8\text{ V}$
- ▶ No V_L supply required
- ▶ 3 V logic-compatible inputs
- ▶ Up to 310 mA continuous current
- ▶ Rail-to-rail operation
- ▶ 8-lead, 2 mm \times 3 mm LFCSP

APPLICATIONS

- ▶ LDMOS power amplifier gate drive
- ▶ GAN power amplifier gate drive
- ▶ Communication systems
- ▶ Automatic test equipment
- ▶ Data acquisition systems
- ▶ Sample-and-hold systems

GENERAL DESCRIPTION

The ADG1519 is a single-pole, double throw (SPDT) switch. An EN input on the lead frame chip scale package (LFCSP) is used to enable or disable the device. When disabled, the switch terminals (SA, SB, and D) are high impedance.

The ADG1519 is fully specified at $V_{DD} = +5\text{ V} \pm 10\%$ and $V_{SS} = -4.5\text{ V to } -8.8\text{ V}$ for applications that require asymmetrical supplies. The ADG1519 on-resistance profile is flat over the full analog input range, ensuring excellent linearity and low distortion when switching audio signals. The construction ensures ultra low power dissipation, making the device ideally suited for portable and battery-powered instruments.

The switch conducts equally well in both directions when on and has an input signal range that extends to the supplies. In the off condition, signal levels up to the supplies are blocked. The ADG1519 exhibits break-before-make switching action for use in multiplexer applications.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

PRODUCT HIGHLIGHTS

1. 5.2 Ω maximum on resistance at 25°C.
2. -135 dB THD.
3. 3 V logic-compatible digital inputs: $V_{INH} = 2.0\text{ V}$ minimum and $V_{INL} = 0.8\text{ V}$ maximum.
4. No logic power supply voltage (V_L) required.
5. 8-lead, 2 mm \times 3 mm LFCSP (see the [Outline Dimensions](#) section).

¹ V_S is the analog voltage for Terminal SA or Terminal SB and I_S is the analog current for Terminal Sx.

² V_D is the analog voltage on Terminal D.

³ V_{IN} is the IN voltage, and V_{GND} is the GND voltage.

⁴ R_L is the load resistance and C_L is the load capacitance.

⁵ V_{SA} is the Source A voltage, and V_{SB} is the Source B voltage.

⁶ R_S is the source resistance.

CONTINUOUS CURRENT PER CHANNEL, SX OR D

Table 2.

Parameter	25°C	85°C	125°C	Unit	Test Conditions/Comments
CONTINUOUS CURRENT PER CHANNEL					
Dual Supply 8-Lead LFCSP ($\theta_{JA} = 64.9^\circ\text{C/W}$)	310	180	95	mA maximum	$V_{DD} = +4.5 \text{ V}$, $V_{SS} = -7.2 \text{ V}$

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 3.

Parameter	Rating
V_{DD} to V_{SS}	18 V
V_{DD} to GND	-0.3 V to +16.5 V
V_{SS} to GND	+0.3 V to -16.5 V
Analog Inputs ¹	$V_{SS} - 0.3$ V to $V_{DD} + 0.3$ V or 30 mA, whichever occurs first
Digital Inputs ¹	GND - 0.3 V to $V_{DD} + 0.3$ V or 30 mA, whichever occurs first
Peak Current, Sx or D (Pulsed at 1 ms, 10% Duty-Cycle Maximum)	600 mA
Continuous Current per Channel, Sx or D	Data in Table 2 + 15% mA
Temperature	
Operating Range	-40°C to +125°C
Storage Range	-65°C to +150°C
Junction	150°C
Reflow Soldering Peak, Pb Free	JEDEC-J-STD-020
Peak Temperature	260°C

¹ Over voltages at IN, Sx, or D are clamped by internal diodes. Limit the current to the maximum ratings given.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to PCB design and operating environment. Careful attention to PCB thermal design is required.

θ_{JA} is the natural convection junction-to-ambient thermal resistance measured in a one cubic foot sealed enclosure, and θ_{JC} is the junction-to-case thermal resistance.

Table 4. Thermal Resistance

Package Type ¹	θ_{JA}	θ_{JC}	Unit
CP-8-31	64.90	14.31	°C/W

¹ Thermal impedance simulated values are based on a JEDEC 2S2P thermal test board with four thermal vias. See JEDEC JESD-51.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES

1. EXPOSED PAD TIED TO SUBSTRATE, V_{SS} .

202

Figure 2. Pin Configuration

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	D	Drain Terminal. The D pin can be an input or output.
2	SA	Source Terminal. The SA pin can be an input or output.
3	GND	Ground (0 V) Reference.
4	V_{DD}	Most Positive Power Supply Potential. Decouple the V_{DD} pin using a 0.1 μF capacitor to GND.
5	EN	Active High Digital Input. When the EN pin is low, the device is disabled, and the SA, SB, and D terminals are high impedance. When the EN pin is high, the IN logic input determines which switch is turned on.
6	IN	Logic Control Input.
7	V_{SS}	Most Negative Power Supply Potential. Decouple the V_{SS} pin using a 0.1 μF capacitor to GND.
8	SB	Source Terminal. The SB pin can be an input or output.
0	EPAD	Exposed Pad. Exposed pad tied to substrate, V_{SS} .

Table 6. Truth Table

EN	IN	D
0	X ¹	High impedance
1	0	SA
1	1	SB

¹ X means don't care.

TERMINOLOGY**I_{DD}**

The positive supply current.

I_{SS}

The negative supply current.

V_D and V_S

The analog voltage on Terminal D and Terminal S.

R_{ON}

The ohmic resistance between Terminal D and Terminal S.

R_{FLAT ON}

Flatness is defined as the difference between the maximum and minimum value of on resistance as measured over the specified analog signal range.

I_S Off

The source leakage current with the switch off.

I_D Off

The drain leakage current with the switch off.

I_D and I_S On

The channel leakage current for Terminal D and Terminal S with the switch on.

V_{INL}

The maximum input voltage for Logic 0.

V_{INH}

The minimum input voltage for Logic 1.

I_{INL} and I_{INH}

The input high and low current of the digital input.

C_S Off

The off switch source capacitance, measured with reference to ground.

C_D Off

The off switch drain capacitance, measured with reference to ground.

C_D and C_S On

The on switch capacitance for Terminal D and Terminal S, measured with reference to ground.

C_{IN}

The digital input capacitance.

t_{ON EN}

Delay time between the 50% and 90% points of the digital input and switch on condition. See [Figure 23](#).

t_{OFF EN}

Delay time between the 50% and 90% points of the digital input and switch off condition. See [Figure 23](#).

t_{TRANSITION}

Delay time between the 50% and 90% points of the digital inputs and the switch on condition when switching from one address state to another.

T_D

Off time measured between the 80% point of both switches when switching from one address state to another. See [Figure 22](#).

Charge Injection

A measure of the glitch impulse transferred from the digital input to the analog output during switching. See [Figure 24](#).

Off Isolation

A measure of unwanted signal coupling through an off switch. See [Figure 25](#).

Crosstalk

A measure of unwanted signal that is coupled through from one channel to another as a result of parasitic capacitance. See [Figure 26](#).

Bandwidth

The frequency at which the output is attenuated by 3 dB. See [Figure 27](#).

Insertion Loss

The loss due to the on resistance of the switch. See [Figure 27](#).

THD + N

The ratio of the harmonic amplitude plus noise of the signal to the fundamental. See [Figure 28](#).

THD

THD is the ratio of the sum of the powers of all harmonic components to the power of the fundamental frequency. See [Figure 28](#).

TERMINOLOGY**AC PSRR**

AC PSRR measures the ability of a device to avoid coupling noise and spurious signals that appear on the supply voltage pin to the output of the switch. The dc voltage on the device is modulated by a sine wave of 0.62 V p-p. The ratio of the amplitude of the signal on the output to the amplitude of the modulation is the AC PSRR. See [Figure 17](#).

APPLICATIONS INFORMATION

POWER AMPLIFIER GATE DRIVE

Figure 29 shows a typical application where the ADG1519 is used to set the gate bias voltage for an RF power amplifier for communications applications. The asymmetrical dual supply and rail-to-rail operation of the ADG1519 allows for negative voltages of up to -8 V for biasing gallium nitride (GaN) power amplifiers while the positive $+5\text{ V}$ rail is ideal for laterally diffused metal-oxide semiconductor (LDMOS) power amplifiers.

Figure 29. GaN Power Amplifier Gate Drive

POWER SUPPLY RAILS

To guarantee correct operation of the ADG1519, $0.1\ \mu\text{F}$ decoupling capacitors are required on the V_{DD} and V_{SS} pins.

The ADG1519 can operate with asymmetrical bipolar supplies between of $V_{\text{DD}} = +5\text{ V} \pm 10\%$ and $V_{\text{SS}} = -4.5\text{ V}$ to -8.8 V . The supplies on V_{DD} and V_{SS} do not have to be asymmetrical. However, the V_{DD} to V_{SS} range must not exceed 18 V as stated in the [Absolute Maximum Ratings](#) section.

POWER SUPPLY RECOMMENDATIONS

Analog Devices, Inc., has a wide range of power management products to meet the requirements of most high performance signal chains.

An example of an asymmetrical bipolar power solution is shown in Figure 30. The ADP5070 (dual switching regulator) generates a positive and negative supply rail for the ADG1519. Also shown in Figure 30 are two optional low dropout regulators (LDOs), the ADP7118 and ADP7182 positive and negative LDOs, respectively, that can be used to reduce the output ripple of the ADP5070 in ultralow noise sensitive applications.

Figure 30. Bipolar Power Solution

Table 7. Recommended Power Management Devices

Product	Description
ADP5070	1 A/0.6 A, dc-to-dc switching regulator with independent positive and negative outputs
ADP7118	20 V, 200 mA, low noise, complementary metal oxide semiconductor (CMOS) LDO linear regulator
ADP7182	-28 V , -200 mA , low noise, LDO linear regulator
