

FEATURES

Digital input stereo, high efficiency Class-D amplifier
Operates from a single 4.5 V to 16.5 V supply
State-of-the-art, proprietary, filterless Σ - Δ modulation
 106.5 dB SNR at $P_o = 8.1$ W, $R_L = 8 \Omega$, $A_v = 19$ dB,
 $PV_{DD} = 12$ V, A weighted
 0.004% THD + N at 5 W into 8 Ω
 38.5 μ V rms output voltage noise, $f = 20$ Hz to 20 kHz,
 A weighted, $PV_{DD} = 16$ V, 8 Ω
Pop and clickless on and off sequence
 2x 14.67 W output at 12 V supply to 4 Ω loads at <1% THD + N
 2x 14.4 W output at 16 V supply to 8 Ω loads at <1% THD + N
Mono mode for increased maximum output power
 1x 49.69 W output at 16 V supply to 2 Ω loads at <1% THD + N
Support for low impedance loads
 As low as 3 $\Omega/5 \mu$ H in stereo mode
 As low as 2 $\Omega/5 \mu$ H in mono mode
High power efficiency
 93.8% efficiency into an 8 Ω load
 90.6% efficiency into a 4 Ω load
 12.34 mA quiescent current with single 12 V PV_{DD} supply
**Single-supply operation with internal LDOs or option to use
 an external 5 V and 1.8 V supply for lowest power
 consumption**
**I²C control and hardware modes with up to 16 pin-selectable
 slots/addresses**

Supported sample rates from 8 kHz to 192 kHz with 24-bit
 resolution
Multiple PCM audio serial data formats
 TDM slave with support for up to 16 devices on a single bus
 I²S or left justified slave
Adjustable full-scale output tailored for many PV_{DD} sources
 2- and 3-cell Li-Ion batteries
Digital volume control with selectable smooth ramp
Automatic power-down function
Supply monitoring automatic gain control (AGC) function
 reduces system brownout
Standalone operational mode without I²C
Temperature sensor with 1 $^{\circ}$ C step readout via I²C
Short-circuit, undervoltage, and thermal protection
Thermal early warning
Power-on reset
 PV_{DD} sensing ADC
40-lead, 6 mm \times 6 mm LFCSP with thermal pad

APPLICATIONS

Mobile computing
 All in one computers
 Portable electronics
 Wireless speakers
 Televisions

GENERAL DESCRIPTION

The SSM3582A is a fully integrated, high efficiency, digital input stereo Class-D audio amplifier. The device can operate from a single supply and requires only a few external components, significantly reducing the circuit bill of materials.

A proprietary, spread spectrum Σ - Δ modulation scheme enables direct connection to the speaker and ensures state-of-the-art analog performance while lowering radiated emissions compared to other Class-D architectures. An optional ultralow electromagnetic interference (EMI) mode significantly reduces radiated emissions above 100 MHz, enabling longer speaker cable lengths. Audio is transmitted digitally to the amplifier, minimizing the possibility of signal corruption in digital environments. The amplifier provides outstanding analog performance, with a 106 dB signal-to-noise ratio and a low 0.004% total harmonic distortion + noise (THD + N).

The SSM3582A operates from a single 4.5 V to 16.5 V supply and is capable of delivering 2×15 W rms continuously into 8 Ω and 4 Ω loads at <1% total harmonic distortion (THD). The efficient modulation scheme maintains excellent power efficiency over a wide range of impedances: 93.8% into an 8 Ω load and 90.6% into a 4 Ω load. Optimization of the output pulse maintains performance at impedances as low as 3 $\Omega/5$ μ H, enabling its use with extended bandwidth tweeters.

The pulse code modulation (PCM) audio serial port supports most common protocols, such as I²S, left justified, and time division multiplexing (TDM), and can address up to 16 devices on a single interface, for up to 32 audio playback channels.

IC operation is controlled through a dedicated I²C interface. The two ADDR_x pins (2 \times , five-level) define up to 16 individual addresses in I²C and standalone modes and automatically set the default TDM slots attribution.

A micropower shutdown mode is triggered by removing the digital audio interface clock, with a typical current of <1 μ A. A software power-down mode is also available.

An automatic power-down feature shuts down the amplifier and the digital-to-analog converter (DAC) when no signal is present at the input, minimizing power consumption during digital silence. The device restarts when nonzero data is present at the input. Mute and unmute transitions are pop and click free.

The SSM3582A is specified over the commercial temperature range of -40°C to $+85^{\circ}\text{C}$. The device has built in thermal shutdown and output short-circuit protection, as well as an early thermal warning with programmable gain limiting to maintain operation.

The SSM3582A is available in a 40-lead, 6 mm \times 6 mm lead frame chip scale package (LFCSP), with a thermal pad to improve heat dissipation.

SPECIFICATIONS

$PV_{DD} = 12\text{ V}$, $AV_{DD} = 5\text{ V}$ (external), $DV_{DD} = 1.8\text{ V}$ (external), load resistance (R_L) = $8\ \Omega + 33\ \mu\text{H}$, $BCLK = 3.072\text{ MHz}$, $FSYNC = 48\text{ kHz}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, unless otherwise noted. The measurements are taken with a 20 kHz AES17 low-pass filter. The other load impedances used are $4\ \Omega + 15\ \mu\text{H}$ and $3\ \Omega + 10\ \mu\text{H}$. Measurements are taken with a 20 kHz AES17 low-pass filter, unless otherwise noted.

Software master power-down indicates that the clocks are turned off. Automatic power-down indicates that there is no dither or zero input signal with clocks on. The device enters soft power-down after 2048 cycles of zero input values. Quiescent indicates triangular dither with zero input signal. All specifications are typical, with a 48 kHz sample rate, in stereo mode, unless otherwise noted.

Table 5. Power-Down Current

Parameter	Symbol	Test Conditions/Comments	Min	Typ	Max	Unit	
POWER-DOWN CURRENT	I _{PVDD}	External AV _{DD} = 5 V and DV _{DD} = 1.8 V, software master power-down, no BCLK/FSYNC					
		PV _{DD} = 5 V		65	463	nA	
		PV _{DD} = 12 V		65	744	nA	
	I _{AVDD}	PV _{DD} = 16 V		65	935	nA	
		AV _{DD} = 5 V external			7.542	22.64	μA
		DV _{DD} = 1.8 V external			2.7	27.27	μA

DIGITAL INPUT/OUTPUT SPECIFICATIONS

Table 6.

Parameter	Min	Typ	Max	Unit
INPUT VOLTAGE ¹				
BCLK, FSYNC, SDATA, SCL, and SDA Pins				
High (V _{IH})	0.7 × DV _{DD}		5.5	V
Low (V _{IL})	-0.3		+0.3 × DV _{DD}	V
INPUT LEAKAGE				
BCLK, FSYNC, SDATA, ADDR _x , SCL, and SDA Pins				
High (I _{IH})			1	μA
Low (I _{IL})			1	μA
INPUT CAPACITANCE			5	pF
OUTPUT DRIVE STRENGTH ¹				
SDA	3		5	mA
SAMPLE RATE (FSYNC FREQUENCY)	8		192	kHz

¹ The pull-up resistor for SCL and SDA must be scaled according to the external pull-up voltage in the system. The typical value for a pull-up resistor for 1.8 V is 2.2 kΩ.

DIGITAL TIMING SPECIFICATIONS

All timing specifications are given for the default setting (I²S mode) of the serial input port.

Table 7.

Parameter	Limit		Unit	Description
	Min	Max		
I²C PORT				
f _{SCL}		400	kHz	SCL frequency
t _{SCLH}	0.26		μs	SCL high
t _{SCLL}	0.5		μs	SCL low
t _{SCS}	0.26		μs	Setup time; relevant for repeated start condition
t _{SCH}	0.26		μs	Hold time; after this period, the first clock is generated
t _{DS}	50		ns	Data setup time
t _{DH}	0.14		μs	Data hold time
t _{SCR}		120	ns	SCL rise time
t _{SCF}		120	ns	SCL fall time
t _{SDR}		120	ns	SDA rise time
t _{SDF}		120	ns	SDA fall time
t _{BFT}	0.5		μs	Bus free time (time between stop and start)

DIGITAL INPUT TIMING SPECIFICATIONS

Table 8.

Parameter	Limit		Unit	Description
	Min	Max		
SERIAL PORT				
t _{BIL}	10		ns	BCLK low pulse width
t _{BIH}	10		ns	BCLK high pulse width
t _{SIS}	4		ns	SDATA setup; time to BCLK rising
t _{SIH}	4		ns	SDATA hold; time from BCLK rising
t _{LIS}	5		ns	FSYNC setup time to BCLK rising
t _{LIH}	5		ns	FSYNC hold time to BCLK rising
t _{BP}	20		ns	Minimum BCLK period

ABSOLUTE MAXIMUM RATINGS

Absolute maximum ratings apply at 25°C, unless otherwise noted.

Table 9.

Parameter	Rating
PVDD Supply Voltage	−0.3 V to +17 V
DVDD Supply Voltage	−0.3 V to +1.98 V
AVDD Supply Voltage	−0.3 V to +5.5 V
PGND and AGND Differential	±0.3 V
Digital Input Pins FSYNC, BCLK, SDATA, SCL, SDA	−0.3 V to +5.5 V
Analog Input Pins ADDRx	−0.3 V to +1.98 V
AVDD_EN	−0.3 V to +17 V
DVDD_EN	−0.3 V to +5.5 V
Electrostatic Discharge (ESD) Susceptibility	
Human Body Model	2 kV
Charged Device Model	1 kV
Temperature Range	
Storage	−65°C to +150°C
Operating	−40°C to +85°C
Junction	−65°C to +150°C
Lead Temperature (Soldering, 60 sec)	300°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

θ_{JA} is the junction to air temperature, and θ_{JC} is the junction to case temperature, and both are specified for the worst case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 10. Thermal Resistance

Package Type	θ_{JA}^1	θ_{JC}^1	Unit
CP-40-7	27	1.1	°C/W

¹ θ_{JA} and θ_{JC} are determined according to JE5D51-9 on a 4-layer (2s2p) PCB with natural convection cooling.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES
1. USE MULTIPLE VIAS TO CONNECT THE EXPOSED PAD TO THE GROUND PLANE ON THE PCB.

21B81-004

Figure 6. Pin Configuration

Table 11. Pin Function Descriptions

Pin No.	Mnemonic	Type ¹	Description
1	PGND	PWR	Left Channel Power Stage Ground.
2	PGND	PWR	Left Channel Power Stage Ground.
3	AVDD_EN	AIN	5 V AVDD Regulator Enable. Connect this pin to PVDD to enable the AVDD regulator or connect to AGND to disable the regulator. When this pin is connected to PVDD, the regulator is enabled. When this pin is connected to AGND, the regulator is disabled.
4	SCL	DIN	I ² C Clock Input.
5	SDA	DIO	I ² C Data.
6	FSYNC	DIN	I ² S/TDM Frame Sync Input.

THEORY OF OPERATION

OVERVIEW

The SSM3582A is a stereo, Class-D audio amplifier with a filterless modulation scheme that greatly reduces external component count, conserving board space and reducing system cost. The SSM3582A does not require an output filter. The device relies on the inherent inductance of the speaker coil and the natural filtering of the speaker and human ear to recover the audio component of the square wave output. Most Class-D amplifiers use some variation of pulse-width modulation (PWM) to generate the output switching pattern, whereas the SSM3582A uses Σ - Δ modulation, resulting in important benefits. Σ - Δ modulators do not produce a sharp peak with many harmonics in the AM broadcast band, as pulse-width modulators often do. Σ - Δ modulation reduces the amplitude of spectral components at high frequencies, reducing EMI emission that may otherwise radiate from speakers and long cable traces. Due to the inherent spread spectrum nature of Σ - Δ modulation, the need for oscillator synchronization is eliminated for designs incorporating multiple SSM3582A amplifiers. The SSM3582A uses less power in quiescent conditions, which helps conserve the power drawn from the battery or power supply.

The SSM3582A integrates overcurrent and temperature protection and a thermal warning with optional programmable automatic gain reduction.

POWER SUPPLIES

PVDD

PVDD supplies the output power stages, as well as the low dropout (LDO) regulator for AVDD and DVDD.

AVDD

AVDD is the analog supply used for the modulator, power stage driver, and other analog blocks.

When the AVDD_EN pin = PVDD, the internal regulator generates 5 V and the AVDD pin is used for decoupling only.

When the AVDD_EN pin = AGND, 5 V must be provided to the AVDD pin from an external system source, minimizing power losses.

DVDD

DVDD supplies the digital circuitry. The current in this node is very low, below 1 mA.

When the DVDD_EN pin = AVDD, the internal regulator generates 1.8 V and the DVDD pin is used for decoupling only.

When the DVDD_EN pin = AGND, 1.8 V must be provided to the DVDD pin from an external system source, minimizing power losses.

Table 12 summarizes the power dissipation in various supply configurations, operating modes, and load characteristics.

Table 12. Typical Power Supply Current Consumption for $f_s = 48 \text{ kHz}$ ¹

¹ N/A means not applicable.

POWER-UP SEQUENCE

Using Only PVDD as a Source

When SSM3582A is used in single-supply mode, all internal rails are generated from PVDD. The internal AVDD (5 V) and DVDD (1.8 V) regulators can be enabled by pulling the AVDD_EN and DVDD_EN pins high. AVDD_EN is pulled to PVDD, and DVDD_EN is pulled to AVDD. The amplifier is operational and responds to I²C writes 10 ms after applying PVDD \geq 5 V.

Using PVDD and External AVDD

Take care when an external 5 V is supplied to AVDD. The internal 5 V LDO regulator must be disabled by pulling the AVDD_EN pin low. In this case, DVDD (1.8 V) is generated from PVDD. It is important to maintain PVDD > AVDD to prevent the back powering of PVDD.

Using PVDD and External AVDD and DVDD

If using an external AVDD and DVDD source, both the AVDD_EN and DVDD_EN pins must be pulled low. It is important to maintain PVDD > AVDD or DVDD to prevent back powering PVDD.

DVDD must be present for the device to respond to I²C commands. The device becomes operational ~10 ms after DVDD is present. PVDD must be at least 5 V for the output stage to turn on, and must be 6 V for optimal performance.

POWER-DOWN OPERATION

The SSM3582A offers several power-down options via the I²C. Register 0x04 provides multiple options for setting the various power-down modes.

When set to 1, the SPWDN bit fully powers down the device. In this case, only the I²C and 1.8 V regulator blocks, if enabled via the DVDD_EN pin, are kept active.

The SSM3582A monitors both the BCLK and FSYNC pins for clock presence. When no BCLK is present, the device automatically powers down all internal circuitry to its lowest power state. When BCLK returns, the device automatically powers up following its usual power sequence. To guarantee click and pop free shutdown, power down the device via the SPDWN control before clock removal.

If enabled, the APWDN_EN bit activates a low power state after 2048 consecutive zero input samples are received. Only the I²C and digital audio input blocks are kept active.

Individual channels can be powered down using Bits[3:2] in Register 0x04.

The temperature sense ADC can be powered down using Bit 5 in Register 0x04.

CLOCKING

A BCLK signal must be provided to the SSM3582A for proper operation. The BCLK signal must have a minimum frequency of 2.048 MHz. The BCLK rate is autodetected, but the sampling frequency must be indicated. The BCLK rates supported at 32 kHz to 48 kHz are 50, 64, 100, 128, 192, 200, 256, 384, 400, 512, 768, 800, and 1024 times the sample rate.

DIGITAL AUDIO SERIAL INTERFACE

The SSM3582A includes a standard serial audio interface that is slave only. The interface is capable of receiving I²S, left justified, PCM, or TDM formatted data.

The serial interfaces have three main operating modes. The stereo modes, typically I²S or left justified, are used when there is a single chip on the interface bus. TDM mode is more flexible and offers the ability to have multiple chips on the bus.

Stereo Operating Modes—I²S, Left Justified

Stereo modes use both edges of FSYNC to determine the placement of data. Stereo mode is enabled when SAI_MODE = 0, and the I²S or left justified format is determined by the SDATA_FMT register setting.

The I²S or left justified interface formats supports various BCLK/FSYNC ratios (see Table 13). Sample rates from 8 kHz to 192 kHz are accepted.

TDM Operating Mode

The TDM operating mode allows multiple chips to connect to a single serial interface.

The FSYNC signal operates at the desired sample rate. A rising edge of the FSYNC signal indicates the start of a new frame. For proper operation, this signal must be one BCLK cycle wide, transitioning on a falling BCLK edge. The MSB of data is present on the SDATA signal one BCLK cycle later. The SDATA signal is latched on a rising edge of BCLK.

Each chip on the TDM bus can occupy 16, 24, 32, 48, or 64 BCLK cycles, set via the TDM_BCLKS control bits. The maximum number of devices connected to a single TDM bus depends on the sample rate and number of bits per channel. The supported combinations of sample rates and bit depths are described in Table 13.

The maximum bit clock frequency is 49.152 MHz. Using the TDM16 format, up to eight devices (16 channels) can be connected to a single TDM interface, and can operate at up to a 96 kHz sample rate and at 32 bits per channel. See Table 13 for the supported options at the 48 kHz, 96 kHz, and 192 kHz sample rates. Note that the interface is slave only, with the bit clock, frame sync, and data provided to the device.

ADDRx pin settings dictate the default TDM slots for each device, and can be modified using the TDM_SLOT_x control register.

Table 13. Supported BCLK Rates in MHz¹

Sample Rate (kHz)	BCLK (MHz)/FSYNC Ratio ²													
	50	64	100	128	192	200	256	384	512	768	800	1024	2048	4096
8 to 12	N/A	N/A	N/A	N/A	N/A	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
16 to 24	N/A	N/A	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	N/A
32 to 48	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	N/A	N/A
64 to 96	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	N/A	N/A	N/A	N/A	N/A
128 to 192	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	N/A	N/A	N/A	N/A	N/A	N/A

¹ Yes means that the specified rate is supported and N/A means not applicable.

² BCLK = (BCLK/FSYNC ratio) × sample rate.

I²C Control

The SSM3582A supports an I²C-compatible, 2-wire serial bus, shared across multiple peripherals. Two signals, serial data (SDA) and serial clock (SCL), carry information between the SSM3582A and the system I²C master controller. The SSM3582A is always a slave on the bus, and cannot initiate a data transfer. Each slave device is identified by a unique address. The address byte format is shown in Table 14. The address resides in the first seven bits of the I²C write. The LSB of this byte sets either a read or write operation. Logic Level 1 corresponds to a read operation and Logic Level 0 corresponds to a write operation. For device address settings, see Table 16.

Table 14. I²C Device Address Byte Format

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	0	1	Bit 3	Bit 2	ADDR0	ADDR1	R/W

Both SDA and SCL are open drain, and require pull-up resistors to the input/output voltage. The SSM3582A operates within the I²C voltage range of 1.6 V to 3.6 V.

Addressing

Initially, each device on the I²C bus is in an idle state, monitoring the SDA and SCL lines for a start condition and the proper address. The I²C master initiates a data transfer by establishing a start condition, defined by a high to low transition on SDA while SCL remains high. This start condition indicates that an address/data stream follows. All devices on the bus respond to the start condition and shift the next eight bits (the 7-bit address plus the R/W bit), MSB first. The device that recognizes the transmitted address responds by pulling the data line low during the ninth clock pulse. This ninth bit is known as an acknowledge bit. All other devices withdraw from the bus at this point and return to the idle condition. The device address for the SSM3582A is determined by the state of the ADDR_x pins. See the Device Address Setting section for more details.

The R/W bit determines the direction of the data. A Logic 0 on the LSB of the first byte means the master writes information to the peripheral, whereas a Logic 1 means the master reads information from the peripheral after writing the subaddress and repeating the start address. A data transfer takes place until a stop condition is

encountered. A stop condition occurs when SDA transitions from low to high while SCL is held high. The timing for the I²C port is shown in Figure 71.

Stop and start conditions can be detected at any stage during the data transfer. If these conditions are asserted out of sequence with normal read and write operations, the SSM3582A immediately jumps to the idle condition. During a given SCL high period, issue only one start condition, one stop condition, or a single stop condition followed by a single start condition. If using an invalid subaddress, the SSM3582A does not issue an acknowledge and returns to the idle condition. If the user exceeds the highest subaddress while in automatic increment mode, one of two actions is taken.

In read mode, the SSM3582A outputs the highest subaddress register contents until the master device issues a no acknowledge, indicating the end of a read. A no acknowledge condition is a condition in which the SDA line is not pulled low on the ninth clock pulse on SCL. If the highest subaddress location is reached while in write mode, the data for the invalid byte is not loaded into any subaddress register, a no acknowledge is issued by the SSM3582A, and the device returns to the idle condition.

Device Address Setting

The device can be set at 16 different I²C addresses using the ADDR1 and ADDR0 pins, as well as 16 hardware modes.

ADDR1 and ADDR0 are sampled during the start-up procedure. These pins set the appropriate operating mode, the I²C address, and the default TDM slots. The ADDR_x pins can be set to five different voltage levels, as defined in Table 15. The ADDR_x pins are referenced to the DVDD rail of the device. Connect pull-up resistors to the internally generated DVDD rail if the regulator is used.

Table 15. ADDR_x Pin Input Level Mapping

ADDR _x State	Level (V)
Connected to Ground	0
Connected to Ground Using a 47 kΩ Resistor	0.45
Left Floating	0.9
Connected to DVDD Using a 47 kΩ Resistor	1.35
Connected to DVDD	1.8

Table 16. ADDR_x Pins to I²C Device Address and TDM Slot Mapping

ADDR _x Pin State ¹		Device Address	Default TDM Slot	
ADDR ₀	ADDR ₁		MONO = 0	MONO = 1
0	0	0x10	1, 2	1
0	1	0x11	3, 4	2
1	0	0x12	5, 6	3
1	1	0x13	7, 8	4
0	Pull-down	0x14	9, 10	5
0	Pull-up	0x15	11, 12	6
1	Pull-down	0x16	13, 14	7
1	Pull-up	0x17	15, 16	8
Pull-down	0	0x18	17, 18	9
Pull-down	1	0x19	19, 20	10
Pull-up	0	0x1A	21, 22	11
Pull-up	1	0x1B	23, 24	12
Pull-down	Pull-down	0x1C	25, 26	13
Pull-down	Pull-up	0x1D	27, 28	14
Pull-up	Pull-down	0x1E	29, 30	15
Pull-up	Pull-up	0x1F	31, 32	16

¹ 0 = connect to ground, 1 = connect to DVDD. In the case of a pull-down state, connect to ground via a 47 kΩ resistor. In the case of a pull-up state, connect to DVDD via a 47 kΩ resistor.

I²C Read and Write Operations

Figure 72 shows the timing of a single-word write operation. Every ninth clock, the SSM3582A issues an acknowledge by pulling SDA low.

Figure 73 shows the timing of a burst mode write sequence. This figure shows an example where the target destination registers are two bytes. The SSM3582A knows to increment its subaddress register every byte because the requested subaddress corresponds to a register or memory area with a byte word length.

The timing of a single-word read operation is shown in Figure 74. Note that the first R/W bit is 0, indicating a write operation, because the subaddress must still be written to set up the internal address. After the SSM3582A acknowledges the receipt of the subaddress, the master must issue a repeated start command, followed by the chip address byte with the R/W set to 1 (read). This repeated command causes the SSM3582A SDA to reverse and to begin driving data back to the master. The master then responds every ninth pulse with an acknowledge pulse to the SSM3582A. Refer to Table 17 for a list of abbreviations in Figure 72 through Figure 75.

Table 17. Abbreviations for Figure 72 Through Figure 75

Symbol	Meaning
S	Start bit
P	Stop bit
A _M	Acknowledge (ACK used in Figure 72 through Figure 75) by master
A _S	Acknowledge (ACK used in Figure 72 through Figure 75) by slave

STANDALONE OPERATION

The SSM3582A can be operated in a standalone hardware control mode without any I²C control. The same ADDR_x pins used to set the I²C device address are used to set the functionality of the device. In standalone mode, the I²C pins (SCL and SDA) are inputs and are shorted to DVDD or AGND to set the TDM slot/sample rate of the device (see Table 18). In this case, the ANA_GAIN bits are set to 11 and SPWDN is set to 0 by default.

In standalone mode, TDM slot selection, mono mode operation, and sample rate are selected via different pin settings. The device monitors the FSYNC signal and, if it is a 50% duty cycle, uses I²S settings. If the FYSNC signal is a pulse, the device uses TDM settings.

Table 18. Standalone Mode Pin Settings and Functionality

Sample Rate	Pin States				TDM Slot(s)	MONO Bit

MONO MODE

The SSM3582A can be operated in mono mode for driving low impedance loads. In mono mode, the left and right power stages can be connected in parallel, as shown in Figure 87. Use caution when setting up mono mode. For proper operation, any hardware changes are required along with setting the register. For mono mode operation, set the MONO bit (Register 0x04, Bit 4) to 1. By default, this bit is set to 0 for stereo mode. After the bit is set for mono mode, only the left channel modulator is active and it feeds both the left and right channel power stages. The OUTL+ and OUTF+ pins are in phase. The OUTL– and OUTF– pins are also in phase. For mono mode, OUTL+ must be shorted to OUTF+. Similarly, OUTL– must be shorted to OUTF–. Note that the resistance of the short must be <10 mΩ. If the short resistance is higher than 10 mΩ, the THD + N performance degrades. Refer to the [EVAL-SSM3582Z](#) user guide for more information.

In standalone mode, the ADDR0, ADDR1, SCL, and SDA pins determine the TDM slot. See the Table 18 for the possible TDM slot configurations in mono mode.

ANALOG AND DIGITAL GAIN

Four different gain settings are available to optimize the dynamic range of the amplifier in relation to the PVDD supply voltage. In software mode, the initial 19 dB gain setting can be updated through the control interface. In standalone mode, the I²C interface pins set the gain of the device. Table 19 summarizes the gain settings and load drive characteristics of the amplifier.

The amplifier analog gain is set prior to enabling the device outputs and must not be changed during operation. A proper mute/unmute sequence is required to prevent audible transients between gain settings.

Finer level control is available in the digital domain, with a very flexible –70 dB to +24 dB, 0.375 dB/step ramp volume control and selectable nonaliasing clipping point. The digital volume

control also includes a playback level limiter that can be set in tandem with the battery voltage monitor to prevent the amplifier from browning out the system when battery level is critically low.

POP AND CLICK SUPPRESSION

Pops and clicks are undesirable audible transients generated by the amplifier system that do not come from the system input signal. Voltage transients as small as 10 mV can be heard as an audible pop in the speaker. Voltage transients at the output of audio amplifiers often occur when shutdown is activated or deactivated. The SSM3582A has a pop and click suppression architecture that reduces these output transients, resulting in noiseless activation and deactivation. Set either mute or power-down before BCLK is removed to ensure a pop free experience.

TEMPERATURE SENSOR

The SSM3582A contains an 8-bit ADC that measures the die temperature of the device and is enabled via the TEMP_PWDN bit in Register 0x04. After the sensor is enabled, the temperature can be read via the I²C in the TEMP register, Register 0x1B. The temperature information is stored in Register 0x1B in an 8-bit, unsigned format. The ADC input range is fixed internally from –60°C to +195°C. To convert the hexadecimal value to the temperature (Celsius) value, use the following steps:

1. Convert the hexadecimal value to decimal and then subtract 60. For example, if the hexadecimal value is 0x54, the decimal value is 84.
2. Calculate the temperature using the following equation:

$$\text{Temperature} = \text{Decimal Value} - 60$$

With a decimal value of 84,

$$\text{Temperature} = 84 - 60 = 24^{\circ}\text{C}$$

Table 19. Analog Gain Settings and Drive Characteristics

ANA_GAIN		Gain (dB)	Output Voltage (V _{out})	
Bit 1	Bit 0		RMS (V _{rms})	Peak (V)
0	0	13	4.38	6.2
0	1	16	6.18	8.75
1	0	19	8.83	12.5
1	1	21	11.22	15.5

Table 20. Fault Reporting Registers

Fault Type	Flag Set Condition	Status Reported Register
PVDD Undervoltage	PVDD below <3.6 V	Register 0x18, Bit 7, UVLO_PVDD
5 V Regulator Undervoltage	5 V regulator voltage at AVDD < 3.6 V	Register 0x18, Bit 6, UVLO_VREG
Limiter/Gain Reduction Engage	Left channel limiter engaged	Register 0x19, Bit 3, LIM_EG_L
	Right channel limiter engaged	Register 0x19, Bit 7, LIM_EG_R
Clipping, Left Channel	Left channel DAC clipping	Register 0x19, Bit 2, CLIP_L
Clipping, Right Channel	Right channel DAC clipping	Register 0x19, Bit 6, CLIP_R
Output Overcurrent	Left channel output current > 6 A peak	Register 0x19, Bit 1, AMP_OC_L
	Right channel output current > 6 A peak	Register 0x19, Bit 5, AMP_OC_R

Die Overtemperature Warning	Die temperature > 117°C	Register 0x18, Bit 0, OTW
Battery Voltage > VBAT_INF_x	Battery voltage PV _{DD} > VBAT_INF_L	Register 0x19, Bit 0, BAT_WARN_L
	Battery voltage PV _{DD} > VBAT_INF_R	Register 0x19, Bit 4, BAT_WARN_R

Table 21. Register 0x16, Register 0x17, Fault Recovery

Fault Type	Flag Set Condition	Status Reported Register
Overtemperature Warning	The amount of gain reduction applied if there is an overtemperature warning for the left channel	Register 0x16, Bits[1:0], OTW_GAIN_L
	The amount of gain reduction applied if there is an overtemperature warning for the right channel	Register 0x16, Bits[5:4], OTW_GAIN_R
Manual Recovery	Use to attempt manual recovery in case of a fault event	Register 0x17, Bit 7, MRCV
Autorecovery Attempts	When autorecovery from faults is used, set the number of attempts using this bit	Register 0x17, Bits[5:4], MAX_AR
Undervoltage	Recovery can be automatic or manual	Register 0x17, Bit 2, ARCV_UV
Die Overtemperature	Recovery can be automatic or manual	Register 0x17, Bit 1, ARCV_OT
Overcurrent	Recovery can be automatic or manual	Register 0x17, Bit 0, ARCV_OC

FAULTS AND LIMITER STATUS REPORTING

The SSM3582A offers comprehensive protections against the faults at the outputs and reporting to help with system design. The faults listed in Table 20 are reported using the status registers.

The faults listed in Table 20 are reported in Register 0x18 and Register 0x19 and can be read via I²C by the microcontroller in the system.

In the event of a fault occurrence, use Register 0x17 to control how the device reacts to the faults.

When the automatic recovery mode is set, the device attempts to recover itself after the fault event and, in case the fault persists, then the device sets the fault again. This process repeats until the fault is resolved.

When the manual recovery mode is used, the device shuts down and the recovery must be attempted using the system microcontroller.

VBAT (PV_{DD}) SENSING

The SSM3582A contains an 8-bit ADC that measures the voltage of the battery voltage (VBAT) or PV_{DD} supply. The battery voltage information is stored in Register 0x1A as an 8-bit unsigned format. The ADC input range is fixed internally at 3.8 V to 16.2 V. To convert the hexadecimal value to the voltage value, use the following steps:

- Convert the hexadecimal value to decimal. For example, if the hexadecimal value is 0xA9, the decimal value is 169.
- Calculate the voltage using the following equation:

$$\text{Voltage} = 3.8 \text{ V} + 12.4 \text{ V} \times \text{Decimal Value}/255$$

With a decimal value of 169,

$$\text{Voltage} = 3.8 \text{ V} + 12.4 \text{ V} \times 169/255 = 12.02 \text{ V}$$

LIMITER AND BATTERY TRACKING THRESHOLD CONTROL

The SSM3582A contains an output limiter that can be used to limit the peak output voltage of the amplifier. The limiter works on the rms and peak value of the signal. The limiter threshold, slope, attack rate, and release rate are programmable using Register 0x0E, Register 0x0F, and Register 0x10 for the left channel and Register 0x11, Register 0x12, Register 0x13 for the right channel. The limiter can be enabled or disabled using LIM_EN_L, Bits[1:0] in Register 0x0E for the left channel and the LIM_EN_R bits, Bits[1:0] in Register 0x11, for the right channel.

The threshold at which the output is limited is determined by the LIM_THRES_L bits setting, Bits[7:3] in Register 0x0F for the left channel, and the LIM_THRES_R bits setting, Bits[7:3] in Register 0x12 for the right channel. When the output signal level exceeds the set threshold level, the limiter activates and limits the signal level to the set limit. Below the set threshold, the output level is not affected.

The limiter threshold can be set above the maximum output voltage of the amplifier. In this case, the limiter allows maximum peak output. In other words, the output may clip depending on the power supply voltage and not the limiter.

The limiter threshold can be set as fixed or to vary with the battery voltage via the VBAT_TRACK_L bit (Register 0x0E, Bit 2) for the left channel and VBAT_TRACK_R bit (Register 0x11, Bit 2) for right channel. When set to fixed, the limiter threshold is fixed and does not vary with battery voltage. The threshold can be set from 2 V peak to 16 V peak using the LIM_THRES_x bit (see Figure 76).

Figure 76. Limiter Fixed (LIM_EN_x = 01, VBAT_TRACK_x = 0)

When set to a variable threshold, the SSM3582A monitors the VBAT supply and automatically adjusts the limiter threshold based on the VBAT supply voltage.

The VBAT supply voltage at which the limiter begins to decrease the output level is determined by the VBAT inflection point (the VBAT_INF_L bits (Register 0x10, Bits[7:0]) for the left channel and VBAT_INF_R bits (Register 0x13, Bits[7:0]) for the right channel).

The VBAT_INF_x point is defined as the battery voltage at which the limiter either activates or deactivates depending on the LIM_EN_x mode (see Table 22). When the battery voltage is greater than VBAT_INF_x, the limiter is not active. When the battery voltage is less than VBAT_INF_x, the limiter is activated. The VBAT_INF_x bits can be set from 3.8 V to 16.2 V. To calculate the 8-bit value for the voltage, use the following equation:

$$\text{Voltage} = 3.8 + 12.4 \times \text{Decimal Value}/255$$

Convert the decimal value to an 8-bit hexadecimal value and use it to set the VBAT_INF_x bits.

The slope bits (Register 0x0F and Register 0x12, Bits[1:0]) determine the rate at which the limiter threshold is lowered relative to the amount of change in VBAT below the VBAT_INF_x point.

The slope is the ratio of the limiter threshold reduction to the VBAT voltage reduction.

$$\text{Slope} = \Delta \text{Limiter Threshold} / \Delta \text{VBAT}$$

The slope ratio can be set from 1:1 to 4:1. This function is useful to prevent early shutdown under low battery conditions. As the VBAT voltage falls, the limiter threshold is lowered. This lower threshold results in the lower output level and therefore helps to reduce the current drawn from the battery and in turn helps prevent early shutdown due to low VBAT.

The limiter offers various active modes that can be set using the LIM_EN_x bits (Register 0x0E and Register 0x11, Bits[1:0]) and the VBAT_TRACK_x bit, as shown in Table 22.

When LIM_EN_x = 01, the limiter is enabled. When LIM_EN_x = 10, the limiter mutes the output if VBAT falls below VBAT_INF_x. When LIM_EN_x = 11, the limiter engages only when the battery voltage is lower than VBAT_INF_x. When VBAT is greater than VBAT_INF_x, no limiting occurs. Note that there is hysteresis on VBAT_INF_x for the limiter disengaging.

The limiter, when active, reduces the gain of the amplifier. The rate of gain reduction or attack rate is determined by the LIM_ATR_x bits (Register 0x0E and Register 0x11, Bits[5:4]). Similarly, when the signal level drops below the limiter threshold, the gain is restored. The gain release rate is determined by the LIM_RRT_x bits (Register 0x0E and Register 0x11, Bits[7:6]).

Figure 77. Limiter Example (LIM_EN_x = 00, VBAT_TRACK_x = 0 or 1)

Table 22. Limiter Modes

LIM_EN_x	VBAT_TRACK_x	Limiter	VBAT < VBAT_INF_x	VBAT > VBAT_INF_x	Comments
00	0 or 1	No	Not applicable	Not applicable	See Figure 77
01	0	Fixed	Use the set threshold	Use the set threshold	See Figure 76
01	1	Variable	Lowers the threshold	Use the set threshold	See Figure 78 and Figure 79
10	0 or 1	Fixed	Mutes the output	Use the set threshold	Not shown

HIGH FREQUENCY CLIPPER

The high frequency clipper can be controlled via the DAC_CLIP_L bits (Register 0x14, Bits[7:0]) and the DAC_CLIP_R bits (Register 0x15, Bits[7:0]).

These bits determine the clipper threshold, relative to full scale. When enabled, the clipper digitally clips the signal after the DAC interpolation.

EMI NOISE

The SSM3582A uses a proprietary modulation and spread spectrum technology to minimize EMI emissions from the device. The SSM3582A passes FCC Class-B emissions testing with an unshielded 20 inch cable using ferrite bead-based filtering. For applications that have difficulty passing FCC Class-B emission tests, the SSM3582A includes an ultralow EMI emissions mode that significantly reduces the radiated emissions at the Class-D outputs, particularly above 100 MHz. Note that reducing the supply voltage greatly reduces radiated emissions.

OUTPUT MODULATION DESCRIPTION

The SSM3582A uses three-level, Σ - Δ output modulation. Each output can swing from ground to PV_{DD} , and vice versa. Ideally, when no input signal is present, the output differential voltage is 0 V because there is no need to generate a pulse. In a real-world situation, noise sources are always present.

Due to this constant presence of noise, a differential pulse is occasionally generated in response to this stimulus. A small amount of current flows into the inductive load when the differential pulse is generated. However, typically, the output differential voltage is 0 V. This feature ensures that the current flowing through the inductive load is small.

When the user sends an input signal, an output pulse is generated to follow the input voltage. The differential pulse density is increased by raising the input signal level. Figure 84 depicts three-level, Σ - Δ output modulation with and without input stimulus.

Figure 84. Three-Level, Σ - Δ Output Modulation With and Without Input Stimulus

BOOTSTRAP CAPACITORS

The output stage of the SSM3582A uses a high-side NMOS driver, rather than a PMOS driver. To generate the gate drive voltage for the high-side NMOS, a bootstrap capacitor for each output terminal acts as a floating power supply for the switching cycle. Use 0.22 μF capacitors to connect the appropriate output pin ($\text{OUTx}\pm$) to the bootstrap pin ($\text{BSTx}\pm$). For example, connect a 0.22 μF capacitor between OUTL+ (a left channel, noninverting output) and BSTL+ for bootstrapping the left channel. Similarly, connect another 0.22 μF capacitor between the OUTL- and BSTL- pins for the left channel inverting output.

POWER SUPPLY DECOUPLING

To ensure high efficiency, low THD, and high PSRR, proper power supply decoupling is necessary. Noise transients on the power supply lines are short duration voltage spikes. These spikes can contain frequency components that extend into the hundreds of megahertz. The power supply input must be decoupled with a good quality, low ESL, low ESR bulk capacitor larger than 220 μF . This capacitor bypasses low frequency noise to the ground plane. For high frequency decoupling, place 1 μF capacitors as close as possible to the PVDD pins of the device.

OUTPUT EMI FILTERING

Additional EMI filtering may be required when the speaker traces and cables are long and present a significant capacitive load that can create additional draw from the amplifier. Typical power ferrites present a significant magnetic hysteresis cycle that affects THD performance and are not recommended for high performance designs. The NFZ filter series from Murata, designed in close collaboration with Analog Devices, Inc., provides a closed hysteresis loop similar to an air coil with minimum impact on performance. Products are available at upwards of 4 A rms, well suited to this application. A small capacitor can be added between the output of the filter and ground to further attenuate very high frequencies. Take care to ensure the capacitor is properly sized to avoid affecting idle power consumption or efficiency.

PCB PLACEMENT

Component selection and placement influence greatly on system performance, both measured and subjective. Proper PVDD layout and decoupling is necessary to reach the specified level of performance, particularly at the highest power levels. The placement shown in Figure 85 ensures proper output stage decoupling for each channel, for minimum supply noise and maximum separation between channels. Additional bulk decoupling is necessary to reduce current ripple at low frequencies, and can be shared between several amplifiers in a multichannel solution.

Figure 85. Recommended Component Placement

LAYOUT

As output power increases, care must be taken to lay out PCB traces and wires properly among the amplifier, load, and power supply. A poor layout increases voltage drops, consequently decreasing efficiency. A good practice is to use short, wide PCB tracks to decrease voltage drops and minimize inductance. For the lowest dc resistance (DCR) and minimum inductance, ensure that track widths for the outputs are at least 200 mil for every inch of length and use 1 oz. or 2 oz. copper.

To maintain high output swing and high peak output power, and to maintain minimal trace resistances, the PCB traces that connect the output pins to the load and supply pins must be as wide as possible. In addition, good PCB layout isolates critical analog paths from sources of high interference. Separate high frequency circuits (analog and digital) from low frequency circuits.

PVDD and PGND carry most of the device current, and must be properly decoupled with multiple capacitors at the device pins. To minimize ground bounce, use independent large traces to carry PVDD and PGND to the power supply, thus reducing

the amount of noise the amplifier bridges inject in the circuit, particularly if common ground impedance is significant. Proper grounding guidelines help improve audio performance, minimize crosstalk between channels, and prevent switching noise from coupling into the audio signal.

Properly designed multilayer PCBs can reduce EMI emission and increase immunity to the RF field by a factor of 10 or more, compared with double sided boards. A multilayer board allows a complete layer to be used for the ground plane, whereas the ground plane side of a double sided board is often disrupted by signal crossover.

If the system has separate analog and digital ground and power planes, the analog ground plane must be directly beneath the analog power plane, and, similarly, the digital ground plane must be directly beneath the digital power plane. There must be no overlap between the analog and digital ground planes or between the analog and digital power planes.

[5:4]	OTW_GAIN_R	0 1 10 11	Right Channel Overtemperature Warning Gain Reduction. No gain reduction. 1.5 dB gain reduction. 3 dB gain reduction. 5.625 dB gain reduction.	0x0	R/W
[3:2]	RESERVED		Reserved.	0x0	R
[1:0]	OTW_GAIN_L	0 1 10 11	Left Channel Overtemperature Warning Gain Reduction. No gain reduction. 1.5 dB gain reduction. 3 dB gain reduction. 5.625 dB gain reduction.	0x0	R/W

Address: 0x17, Reset: 0x30, Name: FAULT_CTRL2

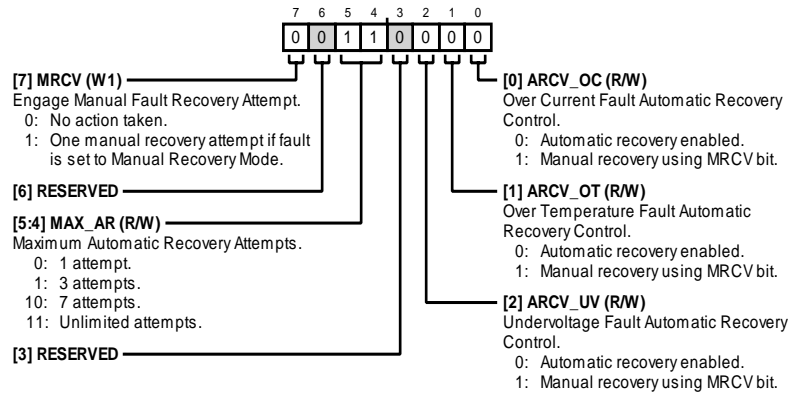

Table 46. Bit Descriptions for FAULT_CTRL2

Bits	Bit Name	Settings	Description	Reset	Access
7	MRCV	0 1	Engage Manual Fault Recovery Attempt. No action taken. One manual recovery attempt if fault is set to Manual Recovery Mode.	0x0	W1
6	RESERVED		Reserved.	0x0	R
[5:4]	MAX_AR	0 1 10 11	Maximum Automatic Recovery Attempts. 1 attempt. 3 attempts. 7 attempts. Unlimited attempts.	0x3	R/W
3	RESERVED		Reserved.	0x0	R

Address: 0x18, Reset: 0x00, Name: STATUS1

Table 47. Bit Descriptions for STATUS1

Bits	Bit Name	Settings	Description	Reset	Access
7	UVLO_PVDD	0 1	PVDD Undervoltage Fault Condition. PVDD \geq 3.6 V. PVDD undervoltage fault condition.	0x0	R
6	UVLO_VREG	0 1	Regulator Undervoltage Fault Condition. No undervoltage fault for AVDD regulator. Undervoltage fault for AVDD regulator.	0x0	R
[5:2]	RESERVED		Reserved.	0x0	R
1	OTF	0 1	Overtemperature Fault Condition. No overtemperature fault. Overtemperature fault.	0x0	R
0	OTW	0 1	Overtemperature Warning Condition. No overtemperature warning. Overtemperature warning.	0x0	R

Address: 0x19, Reset: 0x00, Name: STATUS2

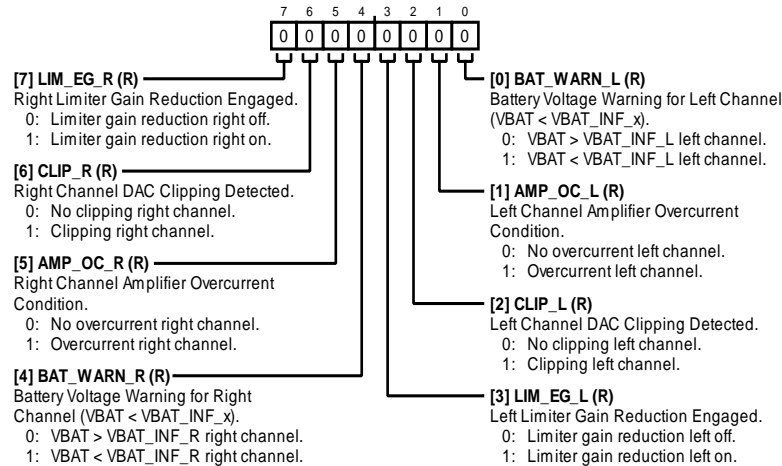

Table 48. Bit Descriptions for STATUS2

Bits	Bit Name	Settings	Description	Reset	Access
7	LIM_EG_R	0 1	Right Limiter Gain Reduction Engaged. Limiter gain reduction right off. Limiter gain reduction right on.	0x0	R
6	CLIP_R	0 1	Right Channel DAC Clipping Detected. No clipping right channel. Clipping right channel.	0x0	R
5	AMP_OC_R	0 1	Right Channel Amplifier Overcurrent Condition. No overcurrent right channel. Overcurrent right channel.	0x0	R
4	BAT_WARN_R	0 1	Battery Voltage Warning for Right Channel (VBAT < VBAT_INF_x). VBAT > VBAT_INF_R right channel. VBAT < VBAT_INF_R right channel.	0x0	R
3	LIM_EG_L	0 1	Left Limiter Gain Reduction Engaged. Limiter gain reduction left off. Limiter gain reduction left on.	0x0	R
2	CLIP_L	0 1	Left Channel DAC Clipping Detected. No clipping left channel. Clipping left channel.	0x0	R
1	AMP_OC_L	0 1	Left Channel Amplifier Overcurrent Condition. No overcurrent left channel. Overcurrent left channel.	0x0	R
0	BAT_WARN_L	0 1	Battery Voltage Warning for Left Channel (VBAT < VBAT_INF_x). VBAT > VBAT_INF_L left channel. VBAT < VBAT_INF_L left channel.	0x0	R

Address: 0x1A, Reset: 0x00, Name: VBAT

Table 49. Bit Descriptions for VBAT

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	VBAT		Battery Voltage Readback.	0x0	R

Address: 0x1B, Reset: 0x00, Name: TEMP

Table 50. Bit Descriptions for TEMP

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	TEMP		Temperature Sensor Readout. The actual temperature in degrees Celsius is TEMP – 60 decimal.	0x0	R

Address: 0x1C, Reset: 0x00, Name: SOFT_RESET

Table 51. Bit Descriptions for SOFT_RESET

Bits	Bit Name	Settings	Description	Reset	Access
[7:1]	RESERVED		Reserved.	0x0	R
0	S_RST	0 1	Full Software Reset. No action taken. Write value of 1 to perform full software reset of device.	0x0	W1

APPLICATIONS INFORMATION

TYPICAL APPLICATION CIRCUIT

Figure 86 shows a typical application circuit for a stereo output. Figure 87 shows a typical application circuit for a mono output.
