

## Integrated Power Module for Small Appliance Motor Drive Applications

### Description

IRSM836-084MA is a 7A, 250V Integrated Power Module (IPM) designed for advanced appliance motor drive applications such as energy efficient fans and pumps. IR's technology offers an extremely compact, high performance AC motor-driver in an isolated package. This advanced IPM offers a combination of IR's low  $R_{DS(on)}$  Trench MOSFET technology and the industry benchmark 3-phase high voltage, rugged driver in a small PQFN package. At only 12x12mm and featuring integrated bootstrap functionality, the compact footprint of this surface-mount package makes it suitable for applications that are space-constrained. Integrated over-current protection, fault reporting and under-voltage lockout functions deliver a high level of protection and fail-safe operation. IRSM836-084MA functions without a heat sink.

### Features

- Integrated gate drivers and bootstrap functionality
- Open-source for leg-shunt current sensing
- Protection shutdown pin
- Low  $R_{DS(on)}$  Trench MOSFET
- Under-voltage lockout for all channels
- Matched propagation delay for all channels
- Optimized dV/dt for loss and EMI trade offs
- 3.3V Schmitt-triggered active high input logic
- Cross-conduction prevention logic
- Motor power range up to ~150W, without heat sink
- Isolation 1500VRMS min

Base Part Number	Package Type	Standard Pack		Orderable Part Number
		Form	Quantity	
IRSM836-084MA	36L PQFN 12 x 12 mm	Tape and Reel	2000	IRSM836-084MATR
		Tray	800	IRSM836-084MA

All part numbers are PbF

### Internal Electrical Schematic

### Absolute Maximum Ratings

Absolute maximum ratings indicate sustained limits beyond which damage to the module may occur. These are not tested at manufacturing. All voltage parameters are absolute voltages referenced to VSS unless otherwise stated in the table.

Symbol	Description	Min	Max	Unit
$BV_{DSS}$	MOSFET Blocking Voltage	---	250	V
$I_o @ T=25^{\circ}C$	DC Output Current per MOSFET	---	7	A
$I_{OP}$	Pulsed Output Current (Note 1)	---	27	
$P_d @ T_C=25^{\circ}C$	Maximum Power Dissipation per MOSFET	---	40	W
$V_{ISO}$	Isolation Voltage (1min) (Note 2)	---	1500	$V_{RMS}$
$T_J$	Operating Junction Temperature	-40	150	$^{\circ}C$
$T_L$	Lead Temperature (Soldering, 30 seconds)	---	260	$^{\circ}C$
$T_S$	Storage Temperature	-40	150	$^{\circ}C$
$V_{S1,2,3}$	High Side Floating Supply Offset Voltage	$V_{B1,2,3} - 20$	$V_{B1,2,3} + 0.3$	V
$V_{B1,2,3}$	High Side Floating Supply Voltage	-0.3	250	V
$V_{CC}$	Low Side and Logic Supply voltage	-0.3	20	V
$V_{IN}$	Input Voltage of LIN, HIN, $I_{TRIP}$ , EN, RCIN, FLT	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V

Note 1: Pulse Width = 100 $\mu$ s,  $T_C = 25^{\circ}C$ , Duty=1%.

Note 2: Characterized, not tested at manufacturing

## Recommended Operating Conditions

Symbol	Description	Min	Max	Unit
V+	Positive DC Bus Input Voltage	---	200	V
V <sub>S1,2,3</sub>	High Side Floating Supply Offset Voltage	(Note 3)	200	V
V <sub>B1,2,3</sub>	High Side Floating Supply Voltage	V <sub>S</sub> +10	V <sub>S</sub> +20	V
V <sub>CC</sub>	Low Side and Logic Supply Voltage	11.5	18.5	V
V <sub>IN</sub>	Input Voltage of LIN, HIN, I <sub>TRIP</sub> , EN, FLT	0	5	V
F <sub>p</sub>	PWM Carrier Frequency	---	20	kHz

The Input/Output logic diagram is shown in Figure 1. For proper operation the module should be used within the recommended conditions. All voltages are absolute referenced to COM. The V<sub>S</sub> offset is tested with all supplies biased at 15V differential.

Note 3: Logic operational for V<sub>S</sub> from COM-5V to COM+250V. Logic state held for V<sub>S</sub> from COM-5V to COM-V<sub>BS</sub>.

## Static Electrical Characteristics

(V<sub>CC</sub>-COM) = (V<sub>B</sub>-V<sub>S</sub>) = 15 V. T<sub>A</sub> = 25°C unless otherwise specified. The V<sub>IN</sub> and I<sub>IN</sub> parameters are referenced to V<sub>SS</sub> and are applicable to all six channels. The V<sub>CCUV</sub> parameters are referenced to V<sub>SS</sub>. The V<sub>BSUV</sub> parameters are referenced to V<sub>S</sub>.

Symbol	Description	Min	Typ	Max	Units	Conditions
BV <sub>DSS</sub>	Drain-to-Source Breakdown Voltage	250	---	---	V	T <sub>J</sub> =25°C, I <sub>LK</sub> =250μA
I <sub>LKH</sub>	Leakage Current of High Side FET's in Parallel		0.5		μA	T <sub>J</sub> =25°C, V <sub>DS</sub> =250V
I <sub>LKL</sub>	Leakage Current of Low Side FET's in Parallel Plus Gate Drive IC		1.5		μA	T <sub>J</sub> =25°C, V <sub>DS</sub> =250V
R <sub>DS(ON)</sub>	Drain to Source ON Resistance	---	0.31	0.45	Ω	T <sub>J</sub> =25°C, V <sub>CC</sub> =15V, I <sub>D</sub> =2A
V <sub>SD</sub>	Mosfet Body Diode Forward Voltage	---	0.8	---	V	T <sub>J</sub> =25°C, V <sub>CC</sub> =15V, I <sub>D</sub> =2A
V <sub>IN,th+</sub>	Positive Going Input Threshold	2.5	---	---	V	
V <sub>IN,th-</sub>	Negative Going Input Threshold	---	---	0.8	V	
V <sub>CCUV+</sub> , V <sub>BSUV+</sub>	V <sub>CC</sub> and V <sub>BS</sub> Supply Under-Voltage, Positive Going Threshold	8	8.9	9.8	V	
V <sub>CCUV-</sub> , V <sub>BSUV-</sub>	V <sub>CC</sub> and V <sub>BS</sub> supply Under-Voltage, Negative Going Threshold	7.4	8.2	9	V	
V <sub>CCUVH</sub> , V <sub>BSUVH</sub>	V <sub>CC</sub> and V <sub>BS</sub> Supply Under-Voltage Lock-Out Hysteresis	---	0.7	---	V	
I <sub>QBS</sub>	Quiescent V <sub>BS</sub> Supply Current V <sub>IN</sub> =0V	---	---	125	μA	
I <sub>QCC</sub>	Quiescent V <sub>CC</sub> Supply Current V <sub>IN</sub> =0V	---	---	3.35	mA	
I <sub>IN+</sub>	Input Bias Current V <sub>IN</sub> =4V	---	100	180	μA	
I <sub>IN-</sub>	Input Bias Current V <sub>IN</sub> =0V	---	--	1	μA	
I <sub>TRIP+</sub>	I <sub>TRIP</sub> Bias Current V <sub>TRIP</sub> =4V	---	5	40	μA	
I <sub>TRIP-</sub>	I <sub>TRIP</sub> Bias Current V <sub>TRIP</sub> =0V	---	--	1	μA	
V <sub>IT, TH+</sub>	I <sub>TRIP</sub> Threshold Voltage	0.37	0.46	0.55	V	

$V_{IT, TH}$	$I_{TRIP}$ Threshold Voltage	---	0.4	---	V	
$V_{IT, HYS}$	$I_{TRIP}$ Input Hysteresis	---	0.06	---	V	
$R_{BR}$	Internal Bootstrap Equivalent Resistor Value	---	200	---	$\Omega$	$T_J=25^\circ\text{C}$
$V_{RCIN, TH}$	RCIN Positive Going Threshold	---	8	---	V	
$R_{ON, FLT}$	FLT Open-Drain Resistance	---	50	100	$\Omega$	

## Dynamic Electrical Characteristics

$(V_{CC-COM}) = (V_B - V_S) = 15\text{ V}$ .  $T_A = 25^\circ\text{C}$  unless otherwise specified.

Symbol	Description	Min	Typ	Max	Units	Conditions
$T_{ON}$	Input to Output Propagation Turn-On Delay Time	---	0.7	1.5	$\mu\text{s}$	$I_D=1\text{mA}$ , $V_+=50\text{V}$ See Fig.2
$T_{OFF}$	Input to Output Propagation Turn-Off Delay Time	---	0.7	1.5	$\mu\text{s}$	
$T_{FIL, IN}$	Input Filter Time (HIN, LIN)	200	330	---	ns	$V_{IN}=0$ & $V_{IN}=4\text{V}$
$T_{FIL, EN}$	Input Filter Time (EN)	100	200	---	ns	$V_{IN}=0$ & $V_{IN}=4\text{V}$
$T_{BLT-ITRIP}$	$I_{TRIP}$ Blanking Time	100	330	---	ns	$V_{IN}=0$ & $V_{IN}=4\text{V}$ , $V_{I/TRIP}=5\text{V}$
$T_{FLT}$	$I_{trip}$ to Fault	---	600	1000	ns	$V_{IN}=0$ & $V_{IN}=4\text{V}$
$T_{EN}$	EN Falling to Switch Turn-Off	---	700	1000	ns	$V_{IN}=0$ & $V_{IN}=4\text{V}$
$T_{ITRIP}$	$I_{TRIP}$ to Switch Turn-Off Propagation Delay	---	950	1300	ns	$I_D=1\text{A}$ , $V_+=50\text{V}$ , See Fig. 3

## MOSFET Avalanche Characteristics

Symbol	Description	Min	Typ	Max	Units	Conditions
EAS	Single Pulse Avalanche Energy	---	139	---	mJ	Note 4

Note 4: From characterization of TO-220 packaged devices. Starting  $T_J=25^\circ\text{C}$ ,  $L=3\text{mH}$ ,  $V_{DD}=75\text{V}$ ,  $I_{AS}=10\text{A}$

## Thermal and Mechanical Characteristics

Symbol	Description	Min	Typ	Max	Units	Conditions
$R_{th(J-CT)}$	Total Thermal Resistance Junction to Case Top	---	21	---	$^\circ\text{C/W}$	One device
$R_{th(J-CB)}$	Total Thermal Resistance Junction to Case Bottom	---	2.9	---	$^\circ\text{C/W}$	One device

**Module Pin-Out Description**

Pin	Name	Description
1	HIN3	Logic Input for High Side Gate Driver - Phase 3
2	LIN1	Logic Input for Low Side Gate Driver - Phase 1
3	LIN2	Logic Input for Low Side Gate Driver - Phase 2
4	LIN3	Logic Input for Low Side Gate Driver - Phase 3
5	/FLT	Fault Output Pin
6	Itrip	Over-Current Protection Pin
7	EN	Enable Pin
8	RCin	Reset Programming Pin
9, 39	VSS, COM	Ground for Gate Drive IC and Low Side Gate Drive Return
10, 11, 30, 37	U, VS1	Output 1, High Side Floating Supply Offset Voltage
12, 13	VR1	Phase 1 Low Side FET Source
14, 15	VR2	Phase 2 Low Side FET Source
16, 17, 38	V, VS2	Output 2, High Side Floating Supply Offset Voltage
18, 19	W, VS3	Output 3, High Side Floating Supply Offset Voltage
20, 21	VR3	Phase 3 Low Side FET Source
22-29	V+	DC Bus Voltage Positive
31	VB1	High Side Floating Supply Voltage 1
32	VB2	High Side Floating Supply Voltage 2
33	VB3	High Side Floating Supply Voltage 3
34	VCC	15V Supply
35	HIN1	Logic Input for High Side Gate Driver - Phase 1
36	HIN2	Logic Input for High Side Gate Driver - Phase 2b

**Note**

Pads 37 and 38 can be omitted from the PCB footprint and hence do not need to be soldered

All pins with the same name are internally connected. For example, pins 10, 11, 30 and 37 are internally connected.

## Fault Reporting and Programmable Fault Clear Timer

The IRSM836-084MA provides an integrated fault reporting output and an adjustable fault clear timer. There are two situations that would cause the IRSM836-084MA to report a fault via the **FLT** pin. The first is an under-voltage condition of **VCC** and the second is when the **ITRIP** pin recognizes a fault.

The fault clear timer provides a means of automatically re-enabling the module operation a preset amount of time after the fault condition has disappeared. When a fault condition occurs, the fault diagnostic output (**FLT**) stays in the low state until the fault condition has been removed and the fault clear timer expires; once the fault clear timer expires, the voltage on the **FLT** pin will return to the logic-high voltage. Figure 4a is a block-level diagram that focuses on the fault diagnostic and fault clear timer functionality of the driver chip within the module. The fault clear timer is defined with a simple resistor-capacitor (RC) network on the **RCin** pin, as shown in Figure 4b.

Figure 5 is a timing diagram showing the states of the **FLT** and **RCin** pins during both normal operation and under a fault condition. Under normal operation, both **FLT** and **RCin** are in high impedance (open drain) states.  $C_{RCIN}$  is fully-charged, and **FLT** is pulled up high. When a fault condition occurs, **RCin** and **FLT** are pulled low to **VSS** –  $C_{RCIN}$  is discharged; once the fault condition has been removed, **RCin** returns to a high impedance state and the fault clear timer begins – that is,  $C_{RCIN}$  starts charging via  $R_{RCIN}$ .  $t_{FLTCLR}$  seconds later – when the **RCin** voltage crosses a datasheet-defined threshold of  $V_{RCIN,TH}$ , **FLT** returns to a high impedance state and the module is operational again.  $t_{FLTCLR}$  is determined by a simple RC network, shown in Figure 6 -  $R_{RCIN}$  and  $C_{RCIN}$  determine how long the voltage at the **RCin** pin takes to reach the  $V_{RCIN,TH}$  fixed threshold.

**Figure 4a:** Block diagram showing internal functioning of fault diagnostic and fault clear timer

**Figure 4b:** Programming the fault clear timer

**Figure 5:** RCIN and FLT pin waveforms

The design guidelines for this network are shown in Table 1.  $C_{RCIN}$  needs to be small enough so that the discharge of the capacitor occurs before the fault condition disappears. If the fault condition disappears before the  $C_{RCIN}$  capacitor is sufficiently discharged, the module will be stuck in fault mode. To achieve sufficiently high fault clear time, it is thus recommend  $R_{RCIN}$  be increased while  $C_{RCIN}$  be kept small.

$C_{RCIN}$	$\leq 1$ nF
	Ceramic
$R_{RCIN}$	0.5 M $\Omega$ to 2 M $\Omega$
	$\gg R_{ON,RCIN}$

**Table 1:** Design guidelines

The length of the fault clear time period can be determined by using the formula below.

$$t_{FLTCLR} = -(R_{RCIN} C_{RCIN}) \ln \left( 1 - \frac{V_{RCIN,TH}}{V_{CC}} \right)$$

If the fault clear timer functionality is not needed, it is sufficient to pull the **RCin** pin up to **VCC** with  $R_{RCIN} \geq 10k\Omega$ . In this case,  $C_{RCIN}$  is not needed.

**Typical Application Connection IRSM836-084MA**

1. Electrolytic bus capacitors should be mounted as close to the module bus terminals as possible to reduce ringing and EMI problems. Additional high frequency ceramic capacitor mounted close to the module pins will further improve performance.
2. In order to provide good decoupling between VCC-VSS and VB1,2,3-VS1,2,3 terminals, the capacitors shown connected between these terminals should be located very close to the module pins. Additional high frequency capacitors, typically 0.1 $\mu$ F, are recommended.
3. Value of the boot-strap capacitors depends upon the switching frequency. Their selection should be made based on IR application note AN-1084.
4. PWM generator must be disabled within Fault duration to guarantee shutdown of the system. Over-current condition must be cleared before resuming operation.

### Current Capability in a Typical Application

Figure 6 shows the current capability for this module at specified conditions. The current capability of the module is affected by application conditions including the PCB layout, ambient temperature, maximum PCB temperature, modulation scheme, PCB copper thickness and so on. The curves below were obtained from measurements carried out on the IRMCS1471\_R4 reference design board which includes the IRSM836-084MA and IR's IRMCF171 digital control IC.

**Figure 6:** Maximum Sinusoidal Phase Current vs. PWM Switching Frequency  
Sinusoidal Modulation,  $V^* = 150V$ ,  $PF = 0.98$

### PCB Example

Figure 7 below shows an example layout for the application PCB. The effective area of the V+ top-layer copper plane is ~3cm<sup>2</sup> in this example. For an FR4 PCB with 1oz copper,  $R_{th(J-A)}$  is about 40°C/W. A lower  $R_{th(J-A)}$  can be achieved using thicker copper and/or additional layers.

**Figure 7:** PCB layout example and corresponding thermal image (6kHz, 2P, 2oz,  $\Delta T_{ca}=70^\circ\text{C}$ ,  $V_+ = 150\text{V}$ ,  $I_u = 870\text{mA}$ ,  $P_o = 148\text{W}$ )

At the module's typical operating conditions,  $dV/dt$  of the phase node voltage is influenced by the load capacitance which includes parasitic capacitance of the PCB, MOSFET output capacitance and motor winding capacitance. To turn off the MOSFET, the load capacitance needs to be charged by the phase current. For the IRMCS1171 reference design, turn-off  $dV/dt$  ranges from 2 to 5 V/ns depending on the phase current magnitude. Turn-on  $dV/dt$  is influenced by PCB parasitic capacitance and motor winding capacitance and typically ranges from 4 to 6 V/ns. The MOSFET turn-on loss combined with the complimentary body diode reverse recovery loss comprises the majority of the total switching losses. Two-phase modulation can be used to reduce switching losses and run the module at higher phase currents.
