

## High power inverse buck for dimmable LED application with MASTERGAN4, HVLED002 and VIPER06XS

### Features

- Input voltage:  $V_{in} = 400 \text{ Vdc}$ ,  $V_{dim} = 10 \text{ Vdc}$
- Output voltage range: 150 V – 350 V
- Output current: 0.7 A – 1 A – 1.3 A, selectable with shunt resistor
- High precision output current, with output current variation lower than 5%
- High efficiency up to 99.4% @  $I_{out} = 1 \text{ A}$   $V_{out} = 350 \text{ V}$
- No heatsink required
- Dimming between 0% - 100%
- PCB dimension: 48.7 mm x 65.1 mm x 37 mm
  - Motherboard: 48.7 mm x 65.1 mm
  - Daughterboard: 30 mm x 40 mm
- RoHS compliant

### Description

This document describes the [EVLMG4-500WIBCK](#) evaluation board, designed to drive a dimmable LED load with a GaN-based, synchronously rectified inverse buck topology; the switching element and diode are replaced by MASTERGAN4, mounted on a daughterboard to obtain a compact and scalable application. The HVLED002 controller manages the inverse buck mainly composed by T1 and MASTERGAN4.

The supply of the HVLED002 is generated by ViPer06XS, that converts the input voltage of the buck to the voltage needed at Vdd pin, eliminating the need of an external power supply.

The circuit is configured to generate 1 A, but different output currents are selectable changing the shunt resistor combination on the daughterboard with the MASTERGAN4.

The board operates with 400 V input voltage and output voltage range between 150 V and 350 V.

A dimming circuit is present on the board. It consists of two circuits: the analog and PWM circuit. It enables the regulation of the output current between the 100% and 0%.

The over voltage and short circuit protection are guaranteed.

# 1 Architecture and component placements

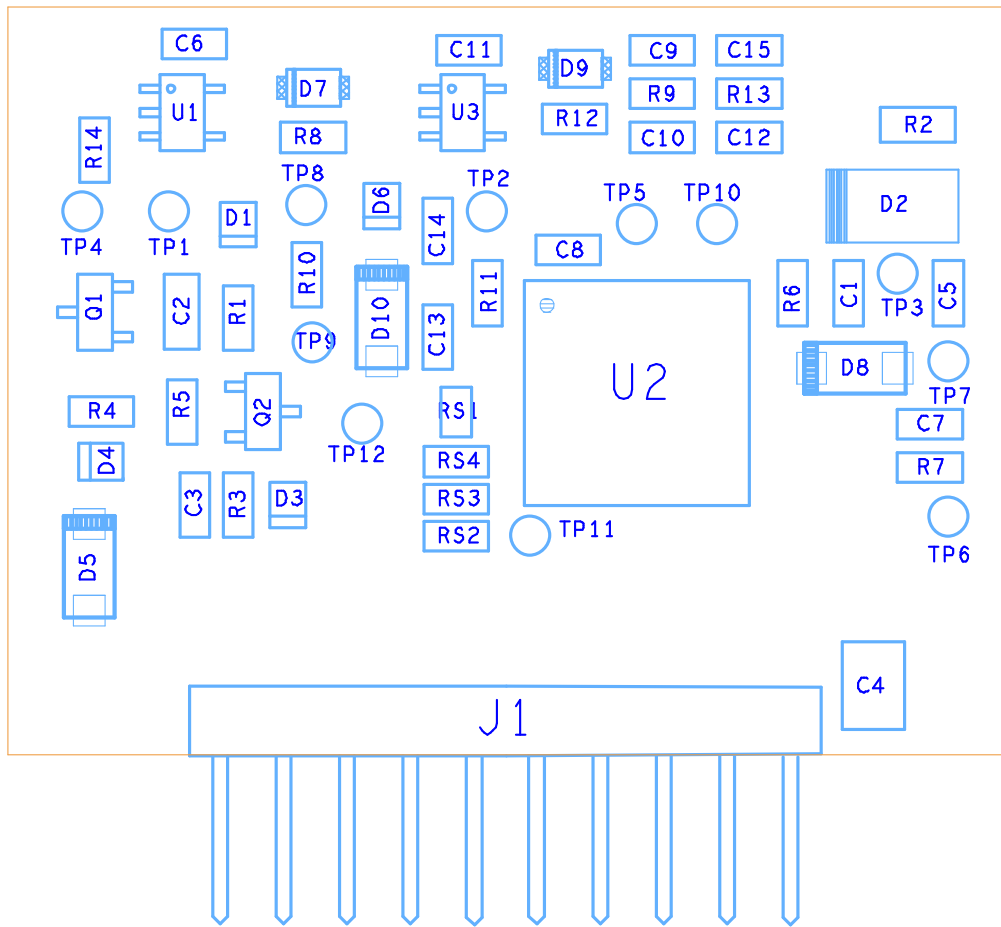

Figure 1. EVLMG4-500WIBCK motherboard – top component placement

**Figure 2. EVLMG4-500WIBCK motherboard – bottom component placement**

**Figure 3. EVLMG4-500WIBCK daughterboard – top component placement**

## 2 Board input connection

The following image shows how to supply the EVLMSG4-500WIBCK (and the connection between mother and daughter board).

**Figure 4. EVLMSG4-500WIBCK – Supply (and connection between mother and daughterboard)**

**Table 1. Connector Map**

Ref	Pin #	Name	Function	Description
J1	1	Vcc	INPUT power	Board supply voltage: set the value at 400 V
	2	GND		Board reference potential
J2	1,2	OUT	OUTPUT	Board output connection (i.e. LED)
J4	1	Vdim	Dimming input	Dimming supply voltage
	2	GND		Signal ground

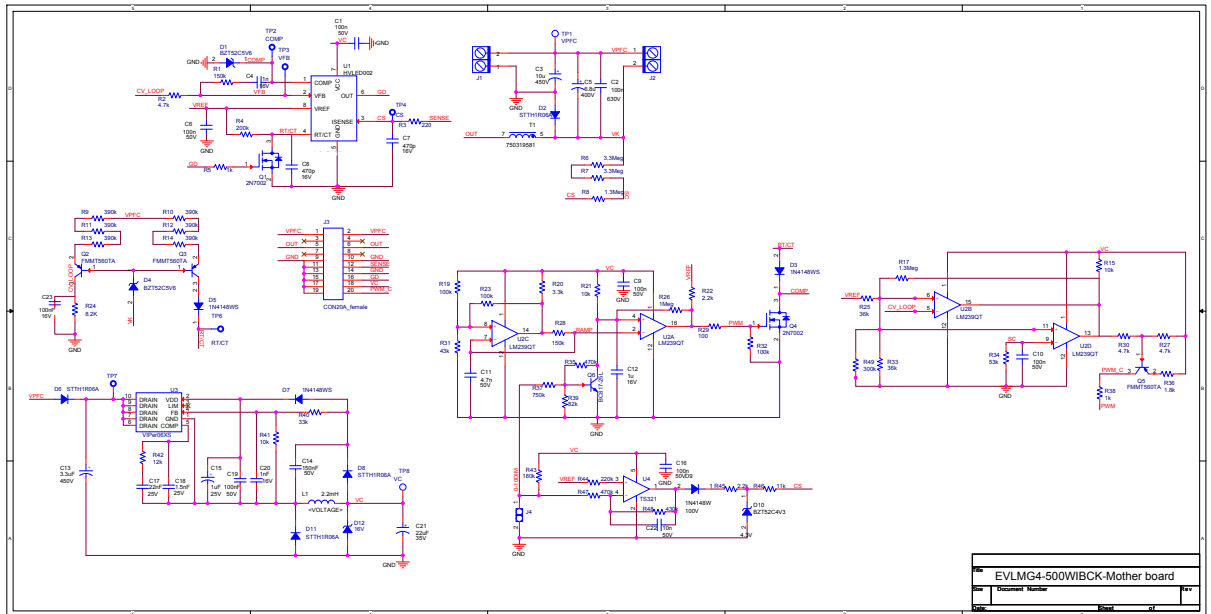

**Table 2. Mother – daughter connection**

Ref	Pin #	Name	Function	Description
J3	1,2	Vcc	INPUT power	MasterGaN4 power supply: set the value at 400 V
	3,4,7,8	N.C.	Not connected	
	5,6	OUT	Half-bridge output	Drain voltage, connected to the inductor
	9,10,11, 13,14,15, 17,19	GND	GND	Signal ground
	12	SENSE	SENSE	Sense pin, determines the duration of the on-time. Connected with the controller.
	18	Vc	Secondary input power	Logic supply voltage. It is fixed by ViPer06XS at 14 V.

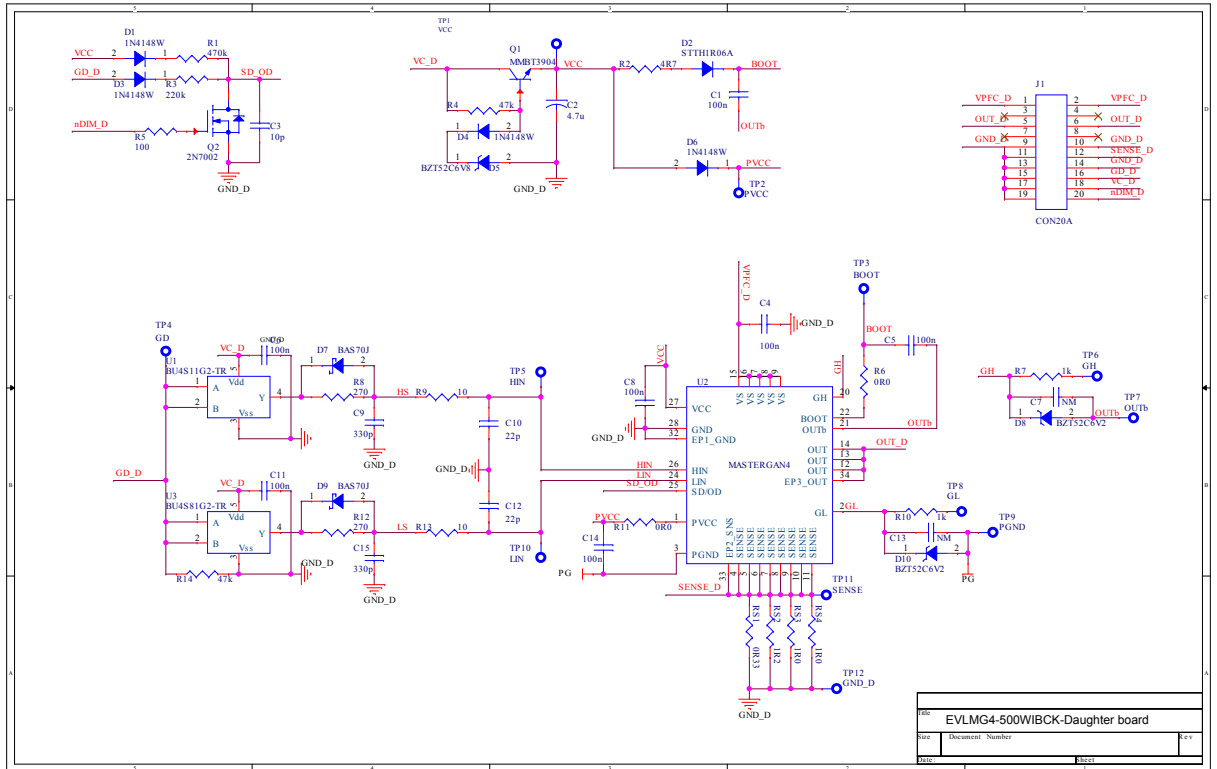

Ref	Pin #	Name	Function	Description
J3	16	GD	Gate driver	Ouput signal from the controller. This signal, through the logic gates embedded on the daughterboard, is split into two complementary signals and drives the MASTERGAN4.
	20	PWM_C	PWM_C	Enable PWM dimming circuit and disable the MASTERGAN4 during the protection
