

## Description

This document describes the specification for the F1385 Digital Pre-Distortion Demodulator for PA linearization. This series of devices is offered in two frequency variants to cover common UTRA bands.

## Competitive Advantage

In typical Base Station transmitters digital pre-distortion is employed to improve the transmitter performance. The signal out of the PA is sampled and the incoming TX chain I & Q data is pre-distorted to counteract the distortion inherent in the PA. The PA signal is adjusted via a digital step attenuator to a lower level and then sub-sampled at an IF frequency of ~350 MHz which necessitates the need for a highly linear demodulator to downconvert to quadrature IF from the transmit frequency. By sampling IF\_I and IF\_Q independently and then digitally combining these signals, an effective doubling of the sample rate can be achieved. Any distortion in this path will degrade the performance of the DPD algorithm. By utilizing an ultra-linear demodulator with integrated DSA such as the F1385, the ACLR and/or power consumption of the full TX system can be improved significantly.

- DPD full path ACLR: Reduced by 1 dB
- $I_{cc}$ : Typically 45% less current
- *Zero-Distortion™* eliminates 2 IF amps
- Integrates 2 Baluns, SP2T RF switch
- *Glitch-Free™* gain control

## Features

- ✓ Wide flat performance IF BW
- ✓ Wide RF BW (~ 1.2 GHz)
- ✓ Ideal for Multi-Carrier Systems
- ✓ Drives ADC directly
- ✓ Ultra linear +39 dBm OIP3
- ✓ Excellent ACLR performance
- ✓ 100  $\Omega$  differential output impedance
- ✓ Fully integrated DPD demodulator
- ✓ 6 x 6 mm 36-pin package
- ✓ Standby Mode w/Fast Recovery
- ✓  $I_{cc}$ : 210 mA

## Pin Descriptions

Table 1. Pin Descriptions

Number	Name	Description
1	SW_LATCH	Stand-by latch. Pull Low or Ground for Normal Operation. If left floating, this input will be internally pulled high, disabling SPI writes to ENb (Standby) and RF SW bits (A0, A2).
2	RF_SEL	RF input selection. Pull high to select RF_INY. Pull low to select RF_INX.
3	RF_INY	Alternate RF Input. Separated from RF_INX by internal SP2T. AC couple to this pin. This is a reflective switch and is not internally matched to 50 ohms.
4, 5, 6, 8, 11, 15, 21, 22, 34, 36	GND	Ground these Pins.
7, 13, 29, 30, 31, 32, 33	NC	No Connection. Not internally connected. OK to connect to Vcc. Recommended Connection is Ground.
9, 16, 25	VCC	Power Supply. Bypass to GND with capacitors shown in the Typical Application Circuit as close as possible to pin.
10	LO_ADJ	Connect the specified resistor from this pin to ground to set the LO path ICC. This is a current setting resistor.
12	LO_IN	LO Input. AC couple to this pin. Internally matched to 50 ohms.
14	STBY	STBY Mode. Pull this pin high for Standby mode (~20 mA). Pull low or Ground for normal operation.
17	IF_BIAS_I	Connect the specified resistor from this pin to ground to set the IF amplifier bias reference. This is NOT a current setting resistor.
18	IF_BIAS_Q	Connect the specified resistor from this pin to ground to set the IF amplifier bias reference. This is NOT a current setting resistor.
19	IF_I+	<i>In-Phase Positive</i> Port Mixer Differential IF Output. Connect pullup inductors from each of these pins to VCC (see the Typical Application Circuit).
20	IF_I-	<i>In-Phase Negative</i> Port Mixer Differential IF Output. Connect pullup inductors from each of these pins to VCC (see the Typical Application Circuit).
23	IF_Q-	<i>Quadrature Negative</i> Port Mixer Differential IF Output. Connect pullup inductors from each of these pins to VCC (see the Typical Application Circuit).
24	IF_Q+	<i>Quadrature Positive</i> Port Mixer Differential IF Output. Connect pullup inductors from each of these pins to VCC (see the Typical Application Circuit).
26	CSb	Chip Select Bar. The falling edge initiates a programming cycle and the rising edge latches the programmed shift register data into the active register.
27	DATA	Serial Data Input.
28	CLK	Serial Clock Input.
35	RF_INX	Main RF Input. Separated from RF_INY by internal SP2T. AC couple to this pin. This is a reflective switch and is not internally matched to 50 ohms.
	— EP	Exposed Pad. Internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple grounds are also required to achieve the noted RF performance.

## Absolute Maximum Ratings

The absolute maximum ratings are stress ratings only. Stresses greater than those listed below can cause permanent damage to the device. Functional operation of the F1385 at absolute maximum ratings is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Table 2. Absolute Maximum Ratings

Parameter	Symbol	Minimum	Maximum	Units
VCC to GND	V <sub>CC</sub>	-0.3	+5.5	V
SW_Latch, DATA, CSb, CLK, RF_SEL	V <sub>CTRL</sub>	-0.3	+3.6	V
STBY	V <sub>STBY</sub>	-0.3	V <sub>CC</sub>	V
IF_I+, IF_I-, IF_Q+, IF_Q-	V <sub>IF</sub>	1	V <sub>CC</sub> + 0.3	V
LO_IN	V <sub>LO</sub>	-0.3	+0.3	V
RF_INX, RF_INY	V <sub>RX</sub>	-0.3	+0.3	V
IF_Bias_I to GND IF_Bias_Q to GND	V <sub>IFBIAS</sub>	-0.3	+1.2	V
LO_ADJ to GND	V <sub>LO_ADJ</sub>	+2.1	+4.0	V
RF Input Power (Into RFIN_X or RFIN_Y) for 24 hours	P <sub>IN</sub>		+27	dBm
Continuous Power Dissipation	P <sub>diss</sub>		2.5	W
Junction Temperature	T <sub>j</sub>		150	°C
Storage Temperature Range	T <sub>st</sub>	-65	150	°C
Lead Temperature (soldering, 10s)			260	°C
ElectroStatic Discharge – HBM (JEDEC/ESDA JS-001-2012)			1000 (Class 1C)	V
ElectroStatic Discharge – CDM (JEDEC 22-C101F)			500 (Class C2)	V

## Recommended Operating Conditions

Table 3. Recommended Operating Conditions

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Supply Voltage	$V_{CC}$	All $V_{CC}$ pins	4.75		5.25	V
Operating Temperature Range	$T_{CASE}$	Exposed Paddle Temperature	-40		+105	°C
RF Frequency Range	$F_{RF}$		3200		4400	MHz
LO Frequency Range	$F_{LO}$		2850		4050	MHz
LO Power	$P_{LO}$		-6	-3	0	dBm
IF Frequency Range	$F_{IF}$		20		500	MHz
RF Input Impedance	$Z_{RF}$	Single Ended		50		$\Omega$
IF Output Impedance	$Z_{IF}$	Differential		100		$\Omega$
LO Input Impedance	$Z_{LO}$	Single Ended		50		$\Omega$

## Electrical Characteristics

Table 4. Electrical Characteristics

See F1385 typical application circuit. Specifications apply at  $V_{CC} = +5.0\text{ V}$ ,  $F_{RF} = 3600\text{ MHz}$ ,  $F_{LO} = 3250\text{ MHz}$ ,  $P_{LO} = 0\text{ dBm}$ ,  $F_{IF} = 350\text{ MHz}$ ,  $\text{Gain} = G_{MAX}$ ,  $T_{CASE} = +25\text{ }^\circ\text{C}$ ,  $STBY = GND$  unless otherwise noted. Full Lineup measured through to I or Q path including 180 degree combiner. The IF transformers and RF input trace losses are de-embedded.

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Logic Input High	$V_{IH}$	For STBY, DATA, CSb, CLK, SW_Latch, RF_Sel	<b>1.1</b>			V
Logic Input Low	$V_{IL}$	For STBY, DATA, CSb, CLK, SW_Latch, RF_Sel			<b>0.5</b>	V
Logic Current	$I_{IH}, I_{IL}$	$V_{IH} = 2.3\text{ V}$ , $V_{IL} = 0\text{ V}$	<b>-107</b>		<b>+10</b>	$\mu\text{A}$
Supply Current	$I_{CC}$	Total $V_{CC}$		210	<b>240</b> <sup>[a]</sup>	mA
Supply Current	$I_{STBY}$	Standby Mode: $STBY > V_{IH}$		20	<b>30</b>	mA
Oversample RF Range	$F_{RFD}$	Measure Gain at I & Q Gain setting = $G_{MAX}$ $F_{IF}$ : 350 MHz $F_{LO}$ : 2850 MHz to 4050 MHz Gain Delta < 3.5 dB	<b>3200</b>		<b>4400</b>	MHz
RF Linearity BW	$RF_{LIN}$	$F_{IF}$ : 350 MHz Gain setting = $G_{MAX}$ Input: RF_INX Pin = -18 dBm/Tone OIP3 > +35 dBm	3400 <sup>[b]</sup>		4200	MHz
Oversample IF Range	$F_{IFD}$	Measure Gain at I & Q Gain setting = $G_{MAX}$ $F_{RF}$ : 3400 MHz to 3880 MHz $F_{LO}$ : 3380 MHz Gain Delta < 2.5 dB	<b>20</b>		<b>500</b>	MHz
IF Linearity BW	$IF_{LIN}$	$F_{RF}$ : 3600 MHz $F_{LO}$ : 3150 MHz to 3500 MHz Gain setting = $G_{MAX}$ Input: RF_INX Pin = -18 dBm/Tone OIP3 > +35 dBm	100	350	450	MHz

[a] Items in min/max columns in **bold italics** are Guaranteed by Test.

[b] Items in min/max columns that are not bold/italics are Guaranteed by Design Characterization.

Table 5. Electrical Characteristics (continued)

See F1385 typical application circuit. Specifications apply at  $V_{CC} = +5.0\text{ V}$ ,  $F_{RF} = 3600\text{ MHz}$ ,  $F_{LO} = 3250\text{ MHz}$ ,  $P_{LO} = 0\text{ dBm}$ ,  $F_{IF} = 350\text{ MHz}$ , Gain =  $G_{MAX}$ ,  $T_{CASE} = +25\text{ }^{\circ}\text{C}$ ,  $STBY = GND$  unless otherwise noted. Full Lineup measured through to I or Q path including 180 degree combiner. The IF transformers and RF input trace losses are de-embedded.

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Gain maximum	$G_{MAX}$	From RF_INX to I & Q Gain setting = $G_{MAX}$ Pin = -20 dBm	<b>16</b>	18	<b>20</b>	dB
Gain minimum	$G_{MIN}$	From RF_INX to I & Q Gain setting = $G_{MIN}$ Pin = +5 dBm		-7.5		dB
Gain Flatness	$G_{FLAT1}$	$F_{RF}$ : 3400 MHz and 3600 MHz $F_{LO}$ : 3150 MHz $F_{IF}$ : 250 MHz and 450 MHz		0.5	<b>0.8</b>	dB
	$G_{FLAT2}$	$F_{RF}$ : 3600 MHz and 3800 MHz $F_{LO}$ : 3350 MHz $F_{IF}$ : 250 MHz and 450 MHz		0.5	<b>0.8</b>	
	$G_{FLAT3}$	$F_{RF}$ : 3350 MHz and 3650 MHz $F_{LO}$ : 3150 MHz $F_{IF}$ : 200 MHz and 500 MHz		1.0	<b>1.5</b>	
	$G_{FLAT4}$	$F_{RF}$ : 3550 MHz and 3850 MHz $F_{LO}$ : 3350 MHz $F_{IF}$ : 200 MHz and 500 MHz		1.0	<b>1.5</b>	
RF Return Loss	$RL_{RF}$			14		dB
LO Return Loss	$RL_{LO}$			10		dB
IF Return Loss	$RL_{IF}$	Differential		15		dB
Noise Figure	NF	From RF_INX to I or Q Gain setting = $G_{MAX}$		20	23	dB
Output IP3 – $G_{MAX}$	$OIP3_{MAX}$	Measured at I & Q $P_{IN} = -18\text{ dBm}$ per tone 5 MHz Tone Separation Gain setting = $G_{MAX}$	<b>35</b>	39		dBm
Output IP3 – $G_{-20}$	$OIP3_{-20}$	Measured at I & Q $P_{IN} = +2\text{ dBm}$ per tone 5 MHz Tone Separation Gain setting = $G_{-20}$		38		dBm
Output IP2	$OIP2$	Measured at I & Q $P_{IN} = -18\text{ dBm}$ per tone 5MHz Tone Separation Gain setting = $G_{MAX}$ $F_1 + F_2$ (High Side)	50	59		dBm

[a] Items in min/max columns in **bold italics** are Guaranteed by Test.

[b] Items in min/max columns that are not bold/italics are Guaranteed by Design Characterization.

Table 6. Electrical Characteristics (continued)

See F1385 typical application circuit. Specifications apply at  $V_{CC} = +5.0\text{ V}$ ,  $F_{RF} = 3600\text{ MHz}$ ,  $F_{LO} = 3250\text{ MHz}$ ,  $P_{LO} = 0\text{ dBm}$ ,  $F_{IF} = 350\text{ MHz}$ ,  $\text{Gain} = G_{MAX}$ ,  $T_{CASE} = +25\text{ }^\circ\text{C}$ ,  $STBY = GND$  unless otherwise noted. Full Lineup measured through to I or Q path including 180 degree combiner. The IF transformers and RF input trace losses are de-embedded.

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
2nd Harmonic	H2	Measured at I & Q $P_{OUT} = -6\text{ dBm}$ Gain setting = $G_{MAX}$		-72	-65	dBc
Input Power 1dB Compression	IP1dB	Measured at I & Q Gain setting = $G_{MAX}$	<b>-2</b>	0		dBm
Quadrature Amplitude Balance	BAL <sub>G</sub>	$F_{LO}$ : 3150 MHz $F_{RF}$ : 3500 MHz	<b>-0.25</b>		<b>+0.25</b>	dB
Quadrature Phase Balance	BAL <sub>φ</sub>	$F_{LO}$ : 3150 MHz $F_{RF}$ : 3500 MHz		1.5		degrees
Equivalent Image Rejection over Environmental Conditions [c]	IR	$T_a = -45\text{ }^\circ\text{C}$ to $T_c = 105\text{ }^\circ\text{C}$ , LO drive = -6 dBm to 0 dBm, LO = 3.0 to 4.0 GHz, IF = 350 MHz Low Side LO	30	35		dB
LO to IF leakage	ISO <sub>LI</sub>	Output Balun has not been de-embedded.		-30	-25	dBm
LO to RF leakage	ISO <sub>LR</sub>			-42		dBm
RF to IF Isolation	ISO <sub>RI</sub>	RF leakage at IF which is relative to IF output level Output balun has not been de-embedded.		-45	-40	dBc
RF Switch Isolation	ISO <sub>RFSW</sub>			-35		dB

[a] Items in min/max columns in **bold italics** are Guaranteed by Test.

[b] Items in min/max columns that are not bold/italics are Guaranteed by Design Characterization.

[c] Calculated from the measured amplitude and phase balance.

Table 7. Electrical Characteristics (continued)

See F1385 typical application circuit. Specifications apply at  $V_{CC} = +5.0\text{ V}$ ,  $F_{RF} = 3600\text{ MHz}$ ,  $F_{LO} = 3250\text{ MHz}$ ,  $P_{LO} = 0\text{ dBm}$ ,  $F_{IF} = 350\text{ MHz}$ ,  $\text{Gain} = G_{MAX}$ ,  $T_{CASE} = +25\text{ }^\circ\text{C}$ ,  $STBY = GND$  unless otherwise noted. Full Lineup measured through to I or Q path including 180 degree combiner. The IF transformers and RF input trace losses are de-embedded.

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Attenuator Range	Range			25.5		dB
Attenuator Resolution	LSB			0.5		dB
Attenuator Glitching	ATTN <sub>G</sub>	Step from 15.5 to 16.0 dB Step from 16.0 to 15.5 dB Measure maximum excursion		0.7		dB
Attenuator Step Accuracy	DNL			0.2		dB
Attenuator Absolute Accuracy	INL	0.5 dB to 25.5 dB range		0.2	<b>1</b>	dB
Serial Clock Speed	F <sub>CLOCK</sub>	SPI 3 wire bus		20	<b>50</b>	MHz
Data to Clock Setup	$\tau_S$	SPI 3 wire bus	3			ns
Data to Clock Hold	$\tau_H$	SPI 3 wire bus	3			ns
Clock to CSb Setup	$\tau_{EN}$	SPI 3 wire bus	3			ns
Clock Pulse Width	$\tau_W$	SPI 3 wire bus	5			ns
<b>RF Switch and attenuator settling times [c]</b>						
EN bit on	EN <sub>ON</sub>	LO_IN: 3250 MHz, 0 dBm RF_INX: 3600 MHz, -20 dBm		100		ns
EN bit off	EN <sub>OFF</sub>			50		ns
RF switched X to Y (no RF Y signal)	RFSW <sub>XY</sub>			150		ns
RF switched Y to X (no RF Y signal)	RFSW <sub>YX</sub>			200		ns
Attenuator Switching Time 0.0 dB to 25.5 dB (max)	ATT <sub>SETL1</sub>			300		ns
Attenuator Switching Time 25.5 dB (max) to 0.0 dB	ATT <sub>SETL2</sub>			300		ns
Attenuator Switching Time 15.5 dB to 16.0 dB	ATT <sub>SETL3</sub>			250		ns
Attenuator Switching Time 16.0 dB to 15.5 dB	ATT <sub>SETL4</sub>			250		ns

[a] Items in min/max columns in **bold italics** are Guaranteed by Test.

[b] Items in min/max columns that are not bold/italics are Guaranteed by Design Characterization.

[c] SPI write time. Define Switching Time: The time from 50% CSb to within 0.1 dB of final value for switching states or 1 dB for isolation.

## Thermal Characteristics

Table 8. Package Thermal Characteristics

Parameter	Symbol	Value	Units
Junction to Ambient Thermal Resistance.	$\theta_{JA}$	40	°C/W
Junction to Case Thermal Resistance. (Case is defined as the exposed paddle)	$\theta_{JC}$	3	°C/W
Moisture Sensitivity Rating (Per J-STD-020)		MSL 1	

## Typical Operating Conditions (TOC)

Unless otherwise noted, for the TOC graphs on the following pages, the following conditions apply:

- IF = 350 MHz
- Tone spacing = 5 MHz
- Pin = - 18dBm / Tone
- Pout ~ 0dBm / Tone
- RF\_X, IF\_Q selected
- Minimum Attenuation selected (0 dB ATTN)
- V<sub>CC</sub> = 5.00 V
- LO level = 0 dBm
- Case (exposed paddle) Temperature = 25 °C
- All Temperatures are Case Temperature (T<sub>CASE</sub> or T<sub>C</sub>)
- Output Transformers losses are de-embedded
- Input RF trace losses are de-embedded
- Measurements are made to the individual IF combined ports (I and Q)

## Power ON Sequence

The power-on sequence ensures F1385 works in default mode once powered on. If the F1385 is programmed after applying DC power, the following power-on sequence is not needed. Note: To use power on sequence, SW\_LATCH cannot be grounded permanently.

The power-on sequence should be:

1. CSb & SW\_LATCH must be set low at power-on.
2. Once powered on, first set SW\_LATCH high, then set CSb high.
3. Proceed with normal programming.

The default state after using power-on sequence:

- Maximum attenuation
- Normal operation (not Standby Mode)

## Regarding Phase of I & Q:

- When LO is high-side injected, IF\_I leads IF\_Q by 90 degrees
- When LO is low-side injected, IF\_Q leads IF\_I by 90 degrees

## Serial Programming

The device is programmed via the serial port by asserting Chip Select (CSb). Note: Most-Significant-Bit (MSB) first, where the Address Word is the most significant.

Figure 117. Serial mode timing diagram high level

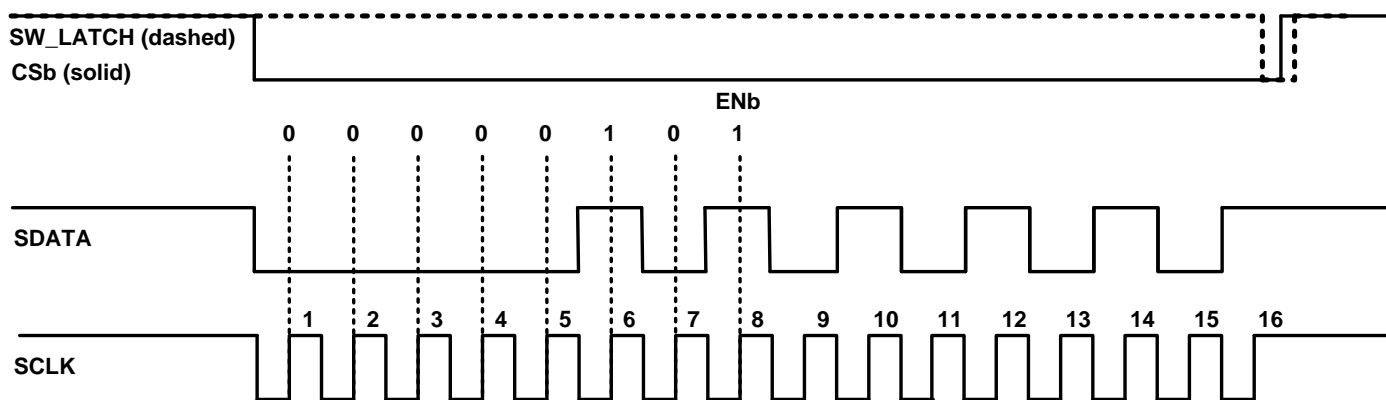

To program the serial interface:

If CSb is de-asserted (set to high), the serial interface will ignore the CLK line. Once CSb is asserted (set to low), the serial interface will recognize the CLK and any data present on DATA will be clocked into the registers with each rising CLK edge. After the 16<sup>th</sup> CLK cycle, and before the 17<sup>th</sup> CLK cycle, CSb must be de-asserted to successfully program the part with the desired bytes. If CSb is de-asserted before the 16<sup>th</sup> CLK cycle, or after the 17<sup>th</sup> CLK cycle, there is no guarantee that the correct bytes will be programmed and the user will have to re-program the interface in accordance with the aforementioned procedure.

SW\_LATCH programming sequence

- When SW\_LATCH is pinned high during the programming sequence, the “ENb” register cannot be programmed and therefore will not toggle.
- If SW\_LATCH is pinned low during the programming sequence, the “ENb” register will toggle. This can be prevented with the “Programming Sequence” below.

Figure 118. Serial mode timing diagram

Sequence for programming registers A<2>:A<0>

1. SW\_Latch = 1; CSb = 0
2. CLK in 8- or 16-bit word, *do not de-assert (pull high) CSb*
3. Set SW\_LATCH = 0 while CSb = 0 remains
4. With SW\_Latch = 0, set CSb = 1
5. Set SW\_Latch = 1
6. Program complete

Figure 119. Serial mode timing diagram zoom:

- Data is shifted with the rising edge of CLK when /CS is low
- The rising edge of /CS latches data into the device

Table 9. Logic Truth Table

STBY	SW_LATCH	Mode	Write Access
0	0	Operating Mode	A2:A0 Enabled, D7:D0 Enabled
0	1	Operating Mode	A2:A0 Disabled, D7:D0 Enabled
1	0	Off	A2:A0 Enabled, D7:D0 Enabled
1	1	Off	A2:A0 Disabled, D7:D0 Enabled

### Attenuation Table

The F1385 attenuation setting is controlled by 6 bits in the data word. The device provides for a attenuation range from 0 dB to 25.5 dB in 0.5 dB steps. A “high” or “1” bit corresponds to attenuation stepped IN, while a “low” or “0” bit corresponds to attenuation stepped OUT.

Because the first and last bits of the Data Word are not presently used by the F1385, two additional hex character pairs exist for each of those in this table. For example, data words of either H00, H80, or H01 (binary “00000000,” “10000000,” or 00000001) will place the F1385 in its minimum attenuation state. Likewise, data words of either H66, HE6, or H67 (binary “01100110” or “11100110” or “01100111”) will place the F1385 in its maximum attenuation state of 25.5 added attenuation.

Table 10. Attenuation Table

State	Attenuation (dB)	Hex	Binary D7 – D0
0	0.0	00	00000000
1	0.5	02	00000010

## Application Information

F1385 has been optimized for use in high performance RF applications from 3200 MHz to 4400 MHz.

### Power Supplies

All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than  $1\text{ V} / 20\text{ }\mu\text{S}$ . In addition, all control pins should remain at 0 V (+/-0.3 V) while the supply voltage ramps or while it returns to zero.

### Control Pin Voltage & Resistance Values (pins not connected)

The following table provides open-circuit DC voltage and resistance values referenced to ground for each of the control pins listed.

Table 12. Control Pin Voltage and resistances

Pin	Name	DC voltage (volts)	Resistance (ohms)
1	SW_LATCH	1.75	1.6M
2	RF_SEL	1.75	800K
14	STBY	5.00	50K
26	CSb	1.75	1.6M
27	DATA	1.75	1.6M
28	CLK	1.75	1.6M

## Package Outline Drawings

The package outline drawings are located at the end of this document and are accessible from the Renesas website (see Ordering Information for POD links). The package information is the most current data available and is subject to change without revision of this document.

## Ordering Information

Orderable Part Number	Package	MSL Rating	Shipping Packaging	Temperature
F1385NBGI	6 x 6 x 0.75 mm <a href="#">36-VFQFPN</a>	MSL1	Tray	-40 °C to +105 °C
F1385NBGI8	6 x 6 x 0.75 mm <a href="#">36-VFQFPN</a>	MSL1	Tape and Reel	-40 °C to +105 °C
F1385EVBI	Evaluation Board			-40 °C to +105 °C
F1385EVS	Evaluation Board with Controller			-40 °C to +105 °C

## Marking Diagram

1. Line 1 and 2 are the part number.
2. Line 3 - "ZA" are ASM Test Step.
3. Line 3 - "1537" is the Date Code YYWW.
4. Line 3 - "G" Assembler Code.
5. Line 4 - "Q414C131MY" Assembly Lot Code.

## Revision History

Revision Date	Description of Change
February 7, 2022	Rebranded to Renesas.
August 16, 2016	Updated spec table, Typ-Ops plots per new device stepping ZA with improved image rejection
October 23, 2015	Production Release

RECOMMENDED LAND PATTERN DIMENSION

NOTES:

1. ALL DIMENSION ARE IN mm. ANGLES IN DEGREES.
2. TOP DOWN VIEW. AS VIEWED ON PCB.
3. COMPONENT OUTLINE SHOW FOR REFERENCE IN GREEN.
4. LAND PATTERN IN BLUE. NSMD PATTERN ASSUMED.
5. LAND PATTERN RECOMMENDATION PER IPC-7351B GENERIC REQUIREMENT FOR SURFACE MOUNT DESIGN AND LAND PATTERN.
