Single 9-A High-Speed, Low-Side Gate Driver

FAN3121, FAN3122

Description

The FAN3121 and FAN3122 MOSFET drivers are designed to drive N-channel enhancement MOSFETs in low-side switching applications by providing high peak current pulses. The drivers are available with either TTL input thresholds (FAN312xT) or V_{DD} -proportional CMOS input thresholds (FAN312xC). Internal circuitry provides an under-voltage lockout function by holding the output low until the supply voltage is within the operating range.

FAN312x drivers incorporate the MillerDrive™ architecture for the final output stage. This bipolar / MOSFET combination provides the highest peak current during the Miller plateau stage of the MOSFET turn-on / turn-off process.

The FAN3121 and FAN3122 drivers implement an enable function on pin 3 (EN), previously unused in the industry-standard pin-out. The pin is internally pulled up to V_{DD} for active HIGH logic and can be left open for standard operation.

The AEC-Q100 automotive-qualified versions are available in 8-lead SOIC packages with and without exposed pad.

Features

- Industry-Standard Pin-out with Enable Input
- 4.5-V to 18-V Operating Range
- 11.4 A Peak Sink at $V_{DD} = 12\text{ V}$
- 9.7-A Sink / 7.1-A Source at $V_{OUT} = 6\text{ V}$
- Inverting Configuration (FAN3121) and
- Non-Inverting Configuration (FAN3122)
- Internal Resistors Turn Driver Off if No Inputs
- 23-ns / 19-ns Typical Rise/Fall Times (10 nF Load)
- 18 ns to 23 ns Typical Propagation Delay Time
- Choice of TTL or CMOS Input Thresholds
- MillerDrive Technology
- 8-Lead SOIC Package (Pb-Free Finish) with Exposed Pad Option
- Rated from -40°C to $+125^{\circ}\text{C}$
- Automotive Qualified to AEC-Q100
- These are Pb-Free Devices

Applications

- Synchronous Rectifier Circuits
- High-Efficiency MOSFET Switching
- Switch-Mode Power Supplies
- DC-to-DC Converters
- Motor Control

PACKAGE OUTLINES

Figure 3. SOIC-8 (Top View)

Figure 4. SOIC-8-EP (Top View)

THERMAL CHARACTERISTICS (Note 1)

Package	θ_{JL} (Note 2)	θ_{JT} (Note 3)	θ_{JA} (Note 4)	Ψ_{JB} (Note 5)	Ψ_{JT} (Note 6)	Unit
8-Pin Small Outline Integrated Circuit (SOIC)	38	29	87	41	2.3	°C/W
8-Pin Small Outline Integrated Circuit with Exposed Pad (SOIC-EP)	5.1	75	40	5.1	7	°C/W

1. Estimates derived from thermal simulation; actual values depend on the application.
2. θ_{JL} (θ_{JL}): Thermal resistance between the semiconductor junction and the bottom surface of all the leads (including any thermal pad) that are typically soldered to a PCB.
3. θ_{JT} (θ_{JT}): Thermal resistance between the semiconductor junction and the top surface of the package, assuming it is held at a uniform temperature by a top-side heatsink.
4. θ_{JA} (θ_{JA}): Thermal resistance between junction and ambient, dependent on the PCB design, heat sinking, and airflow. The value given is for natural convection with no heatsink using a 2S2P board, as specified in JEDEC standards JESD51-2, JESD51-5, and JESD51-7, as appropriate.
5. Ψ_{JB} (Ψ_{JB}): Thermal characterization parameter providing correlation between semiconductor junction temperature and an application circuit board reference point for the thermal environment defined in Note 4. For the SOIC-8-EP package, the board reference is defined as the PCB copper connected to the thermal pad and protruding from either end of the package. For the SOIC-8 package, the board reference is defined as the PCB copper adjacent to pin 6.
6. Ψ_{JT} (Ψ_{JT}): Thermal characterization parameter providing correlation between the semiconductor junction temperature and the center of the top of the package for the thermal environment defined in Note 4.

FAN3121, FAN3122

PIN DEFINITIONS

FAN3121	FAN3122	Name	Description
3	3	EN	<i>Enable Input.</i> Pull pin LOW to inhibit driver. EN has logic thresholds for both TTL and CMOS IN thresholds.
4, 5	4, 5	GND	<i>Ground.</i> Common ground reference for input and output circuits.
2	2	IN	<i>Input.</i>
	6, 7	OUT	<i>Gate Drive Output.</i> Held LOW unless required input is present and V_{DD} is above the UVLO threshold.
6, 7		$\overline{\text{OUT}}$	<i>Gate Drive Output (inverted from the input).</i> Held LOW unless required input is present and V_{DD} is above the UVLO threshold.
1, 8	1, 8	V_{DD}	<i>Supply Voltage.</i> Provides power to the IC.
		P1	<i>Thermal Pad (SOIC-8-EP only).</i> Exposed metal on the bottom of the package; it is recommended to connect externally on the PCB the Exposed Pad together with the Ground. NOT suitable for carrying current.

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Min	Max	Unit
V_{DD}	V_{DD} to GND	-0.3	20.0	V
V_{EN}	EN to GND	GND - 0.3	$V_{DD} + 0.3$	V
V_{IN}	IN to GND	GND - 0.3	$V_{DD} + 0.3$	V
V_{OUT}	OUT to GND	GND - 0.3	$V_{DD} + 0.3$	V
T_L	Lead Soldering Temperature (10 Seconds)	-	+260	°C
T_J	Junction Temperature	-55	+150	°C
T_{STG}	Storage Temperature	-65	+150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Max	Unit
V_{DD}	Supply Voltage Range	4.5	18.0	V
V_{EN}	Enable Voltage EN	0	V_{DD}	V
V_{IN}	Input Voltage IN	0	V_{DD}	V
T_A	Operating Ambient Temperature	-40	+125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

13. The initial spike in each current waveform is a measurement artifact caused by the stray inductance of the current-measurement loop.

APPLICATIONS INFORMATION

The FAN3121 and FAN3122 family offers versions in either TTL or CMOS input configuration. In the FAN3121T and FAN3122T, the input thresholds meet industry-standard TTL-logic thresholds independent of the V_{DD} voltage, and there is a hysteresis voltage of approximately 0.7 V. These levels permit the inputs to be driven from a range of input logic signal levels for which a voltage over 2 V is considered logic HIGH. The driving signal for the TTL inputs should have fast rising and falling edges with a slew rate of 6 V/ μ s or faster, so the rise time from 0 to 3.3 V should be 550 ns or less.

The FAN3121 and FAN3122 output can be enabled or disabled using the EN pin with a very rapid response time. If EN is not externally connected, an internal pull-up resistor enables the driver by default. The EN pin has logic thresholds for parts with either TTL or CMOS IN thresholds.

In the FAN3121C and FAN3122C, the logic input thresholds are dependent on the V_{DD} level and, with V_{DD} of 12 V, the logic rising edge threshold is approximately 55% of V_{DD} and the input falling edge threshold is approximately 38% of V_{DD} . The CMOS input configuration offers a hysteresis voltage of approximately 17% of V_{DD} . The CMOS inputs can be used with relatively slow edges (approaching DC) if good decoupling and bypass techniques are incorporated in the system design to prevent noise from violating the input voltage hysteresis window. This allows setting precise timing intervals by fitting an R-C circuit between the controlling signal and the IN pin of the driver. The slow rising edge at the IN pin of the driver introduces a delay between the controlling signal and the OUT pin of the driver.

Static Supply Current

In the I_{DD} (static) Typical Performance Characteristics, the curves are produced with all inputs / enables floating (OUT is LOW) and indicates the lowest static I_{DD} current for the tested configuration. For other states, additional current flows through the 100 k Ω resistors on the inputs and outputs, as shown in the block diagram (see Figure 7). In these cases, the actual static I_{DD} current is the value obtained from the curves, plus this additional current.

MillerDrive Gate-Drive Technology

FAN312x gate drivers incorporate the MillerDrive architecture shown in Figure 46. For the output stage, a combination of bipolar and MOS devices provide large currents over a wide range of supply voltage and temperature variations. The bipolar devices carry the bulk of the current as OUT swings between 1/3 to 2/3 V_{DD} and the MOS devices pull the output to the HIGH or LOW rail.

The purpose of the Miller Drive architecture is to speed up switching by providing high current during the Miller plateau region when the gate-drain capacitance of the MOSFET is being charged or discharged as part of the turn-on / turn-off process.

For applications with zero voltage switching during the MOSFET turn-on or turn-off interval, the driver supplies high peak current for fast switching, even though the Miller plateau is not present. This situation often occurs in synchronous rectifier applications because the body diode is generally conducting before the MOSFET is switched on.

The output pin slew rate is determined by V_{DD} voltage and the load on the output. It is not user adjustable, but a series resistor can be added if a slower rise or fall time at the MOSFET gate is needed.

Figure 46. Miller Drive Output Architecture

Under-Voltage Lockout (UVLO)

The FAN312x startup logic is optimized to drive ground-referenced N-channel MOSFETs with an under-voltage lockout (UVLO) function to ensure that the IC starts in an orderly fashion. When V_{DD} is rising, yet below the 4.0 V operational level, this circuit holds the output low, regardless of the status of the input pins. After the part is active, the supply voltage must drop 0.25 V before the part shuts down. This hysteresis helps prevent chatter when low V_{DD} supply voltages have noise from the power switching. This configuration is not suitable for driving high-side P-channel MOSFETs because the low output voltage of the driver would turn the P-channel MOSFET on with V_{DD} below 4.0 V.

V_{DD} Bypassing and Layout Considerations

The FAN3121 and FAN3122 are available in either 8-lead SOIC or SOIC8-EP packages. In either package, the V_{DD} pins 1 and 8 and the GND pins 4 and 5 should be connected together on the PCB.

In typical FAN312x gate-driver applications, high-current pulses are needed to charge and discharge the gate of a power MOSFET in time intervals of 50 ns or less. A bypass capacitor with low ESR and ESL should be connected directly between the V_{DD} and GND pins to provide these large current pulses without causing unacceptable ripple on the V_{DD} supply. To meet these requirements in a small size, a ceramic capacitor of 1 μF or larger is typically used, with a dielectric material such as X7R, to limit the change in capacitance over the temperature and / or voltage application ranges.

Figure 47 shows the pulsed gate drive current path when the gate driver is supplying gate charge to turn the MOSFET on. The current is supplied from the local bypass capacitor C_{BYP} and flows through the driver to the MOSFET gate and to ground. To reach the high peak currents possible with the FAN312x family, the resistance and inductance in the path should be minimized. The localized C_{BYP} acts to contain the high peak current pulses within this driver-MOSFET circuit, preventing them from disturbing the sensitive analog circuitry in the PWM controller.

Figure 47. Current Path for MOSFET Turn-On

Figure 48 shows the path the current takes when the gate driver turns the MOSFET off. Ideally, the driver shunts the current directly to the source of the MOSFET in a small circuit loop. For fast turn-off times, the resistance and inductance in this path should be minimized.

Figure 48. Current Path for MOSFET Turn-Off

Operational Waveforms

At power up, the FAN3121 inverting driver shown in Figure 49 holds the output LOW until the V_{DD} voltage reaches the UVLO turn-on threshold, as indicated in Figure 50. This facilitates proper startup control of low-side N-channel MOSFETs.

Figure 49. Inverting Configuration

The OUT pulses' magnitude follows V_{DD} magnitude with the output polarity inverted from the input until steady-state V_{DD} is reached.

Figure 50. Inverting Startup Waveforms

At power up, the FAN3122 non-inverting driver, shown in Figure 51, holds the output LOW until the V_{DD} voltage reaches the UVLO turn-on threshold, as indicated in Figure 52. The OUT pulses magnitude follow V_{DD} magnitude until steady-state V_{DD} is reached.

Figure 51. Non-Inverting Driver

Figure 52. Non-Inverting Startup Waveforms

Thermal Guidelines

Gate drivers used to switch MOSFETs and IGBTs at high frequencies can dissipate significant amounts of power. It is important to determine the driver power dissipation and the resulting junction temperature in the application to ensure that the part is operating within acceptable temperature limits.

The total power dissipation in a gate driver is the sum of two components, P_{GATE} and $P_{DYNAMIC}$:

$$P_{TOTAL} = P_{GATE} + P_{DYNAMIC} \quad (eq. 1)$$

Gate Driving Loss: The most significant power loss results from supplying gate current (charge per unit time) to switch the load MOSFET on and off at the switching frequency. The power dissipation that results from driving a MOSFET at a specified gate-source voltage, V_{GS} , with gate charge, Q_G , at switching frequency, f_{SW} , is determined by:

$$P_{GATE} = Q_G \cdot V_{GS} \cdot f_{SW} \quad (eq. 2)$$

Dynamic Pre-drive / Shoot-through Current: A power loss resulting from internal current consumption under dynamic operating conditions, including pin pull-up / pull-down resistors, can be obtained using graphs in Typical Performance Characteristics to determine the current $I_{DYNAMIC}$ drawn from V_{DD} under actual operating conditions:

$$P_{DYNAMIC} = I_{DYNAMIC} \cdot V_{DD} \quad (eq. 3)$$

Once the power dissipated in the driver is determined, the driver junction rise with respect to circuit board can be evaluated using the following thermal equation, assuming ψ_{JB} was determined for a similar thermal design (heat sinking and air flow):

$$T_J = P_{TOTAL} \cdot \psi_{JB} + T_B \quad (eq. 4)$$

where:

T_J = driver junction temperature;

ψ_{JB} = (ψ) thermal characterization parameter relating temperature rise to total power dissipation; and

T_B = board temperature in location as defined in the [Thermal Characteristics](#) table.

In a full-bridge synchronous rectifier application, shown in Figure 53, each FAN3122 drives a parallel combination of two high-current MOSFETs, (such as FDMS8660S). The typical gate charge for each SR MOSFET is 70 nC with $V_{GS} = V_{DD} = 9$ V. At a switching frequency of 300 kHz, the total power dissipation is:

$$P_{GATE} = 2 \cdot 70 \text{ nC} \cdot 9 \text{ V} \cdot 300 \text{ kHz} = 0.378 \text{ W} \quad (eq. 5)$$

$$P_{DYNAMIC} = 2 \text{ mA} \cdot 9 \text{ V} = 18 \text{ mW} \quad (eq. 6)$$

$$P_{TOTAL} = 0.396 \text{ W} \quad (eq. 7)$$

The SOIC-8 has a junction-to-board thermal characterization parameter of $\psi_{JB} = 42^\circ\text{C/W}$. In a system application, the localized temperature around the device is a function of the layout and construction of the PCB along with airflow across the surfaces. To ensure reliable operation, the maximum junction temperature of the device must be prevented from exceeding the maximum rating of 150°C ; with 80% derating, T_J would be limited to 120°C . Rearranging Equation 4 determines the board temperature required to maintain the junction temperature below 120°C :

$$T_{B,MAX} = T_J - P_{TOTAL} \cdot \psi_{JB} \quad (eq. 8)$$

$$T_{B,MAX} = 120^\circ\text{C} - 0.396 \text{ W} \cdot 42^\circ\text{C/W} = 104^\circ\text{C} \quad (eq. 9)$$

Consider tradeoffs between reducing overall circuit size with junction temperature reduction for increased reliability.

ORDERING INFORMATION

Part Number	Logic	Input Threshold	Package	Shipping†
FAN3121CMX-F085	Inverting Channels + Enable	CMOS	SOIC-8	2,500 / Tape & Reel
FAN3121TMX-F085		TTL	SOIC-8	2,500 / Tape & Reel
FAN3122CMX-F085	Non-Inverting Channels + Enable	CMOS	SOIC-8	2,500 / Tape & Reel
FAN3122TMX-F085		TTL	SOIC-8	2,500 / Tape & Reel
FAN3122TM1X-F085			SOIC-8-EP	2,500 / Tape & Reel

†For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

Table 1. RELATED PRODUCTS

Part Number	Type	Gate Drive (Note 14) (Sink/Src)	Input Threshold	Logic	Package (Note 16)
FAN3216T	Dual 2 A	+2.4 A / -1.6 A	TTL	Dual Inverting Channels	SOIC8
FAN3217T	Dual 2 A	+2.4 A / -1.6 A	TTL	Dual Non-Inverting Channels	SOIC8
FAN3226C	Dual 2 A	+2.4 A / -1.6 A	CMOS	Dual Inverting Channels + Dual Enable	SOIC8
FAN3226T	Dual 2 A	+2.4 A / -1.6 A	TTL	Dual Inverting Channels + Dual Enable	SOIC8
FAN3227C	Dual 2 A	+2.4 A / -1.6 A	CMOS	Dual Non-Inverting Channels + Dual Enable	SOIC8
FAN3227T	Dual 2 A	+2.4 A / -1.6 A	TTL	Dual Non-Inverting Channels + Dual Enable	SOIC8
FAN3228C	Dual 2 A	+2.4 A / -1.6 A	CMOS	Dual Channels of Two-Input / One-Output	SOIC8
FAN3228T	Dual 2 A	+2.4 A / -1.6 A	TTL	Dual Channels of Two-Input / One-Output	SOIC8
FAN3229C	Dual 2 A	+2.4 A / -1.6 A	CMOS	Dual Channels of Two-Input / One-Output	SOIC8
FAN3229T	Dual 2 A	+2.4 A / -1.6 A	TTL	Dual Channels of Two-Input / One-Output	SOIC8
FAN3268T	Dual 2 A	+2.4 A / -1.6 A	TTL	20 V Non-Inverting Channel (NMOS) and Inverting Channel (PMOS) + Dual Enables	SOIC8
FAN3223C	Dual 4 A	+4.3 A / -2.8 A	CMOS	Dual Inverting Channels + Dual Enable	SOIC8
FAN3213T	Dual 4 A	+4.3 A / -2.8 A	TTL	Dual Inverting Channels	SOIC8
FAN3214T	Dual 4 A	+4.3 A / -2.8 A	TTL	Dual Non-Inverting Channels	SOIC8
FAN3223T	Dual 4 A	+4.3 A / -2.8 A	TTL	Dual Inverting Channels + Dual Enable	SOIC8
FAN3224C	Dual 4 A	+4.3 A / -2.8 A	CMOS	Dual Non-Inverting Channels + Dual Enable	SOIC8
FAN3224T	Dual 4 A	+4.3 A / -2.8 A	TTL	Dual Non-Inverting Channels + Dual Enable	SOIC8, SOIC8-EP
FAN3225C	Dual 4 A	+4.3 A / -2.8 A	CMOS	Dual Channels of Two-Input / One-Output	SOIC8
FAN3225T	Dual 4 A	+4.3 A / -2.8 A	TTL	Dual Channels of Two-Input / One-Output	SOIC8
FAN3121C	Single 9 A	+9.7 A / -7.1 A	CMOS	Single Inverting Channel + Enable	SOIC8
FAN3121T	Single 9 A	+9.7 A / -7.1 A	TTL	Single Inverting Channel + Enable	SOIC8
FAN3122C	Single 9 A	+9.7 A / -7.1 A	CMOS	Single Non-Inverting Channel + Enable	SOIC8
FAN3122T	Single 9 A	+9.7 A / -7.1 A	TTL	Single Non-Inverting Channel + Enable	SOIC8, SOIC8-EP

14. Typical currents with OUT at 6 V and $V_{DD} = 12$ V.

15. Thresholds proportional to an externally supplied reference voltage.

16. Automotive-qualified F085 versions are offered in SOIC8 packages, some in SOIC-8-EP package

FAN3121, FAN3122

PACKAGE DIMENSIONS

SOIC8
CASE 751EB
ISSUE A

DATE 24 AUG 2017

NOTES:

- A) THIS PACKAGE CONFORMS TO JEDEC MS-012, VARIATION AA.
- B) ALL DIMENSIONS ARE IN MILLIMETERS.
- C) DIMENSIONS DO NOT INCLUDE MOLD FLASH OR BURRS.
- D) LANDPATTERN STANDARD: SOIC127P600X175-8M
