

165-Bump BGA
Commercial Temp
Industrial Temp

**18Mb SigmaQuad-II+
Burst of 4 SRAM**

435 MHz–300 MHz
1.8 V V_{DD}
1.8 V and 1.5 V I/O

Features

- 2.0 Clock Latency
- Simultaneous Read and Write SigmaQuad™ Interface
- JEDEC-standard pinout and package
- Dual Double Data Rate interface
- Byte Write controls sampled at data-in time
- Burst of 4 Read and Write
- 1.8 V +100/-100 mV core power supply
- 1.5 V or 1.8 V HSTL Interface
- Pipelined read operation
- Fully coherent read and write pipelines
- ZQ pin for programmable output drive strength
- Data Valid Pin (QVLD)
- IEEE 1149.1 JTAG-compliant Boundary Scan
- 165-bump, 13 mm x 15 mm, 1 mm bump pitch BGA package
- RoHS-compliant 165-bump BGA package available

SigmaQuad™ Family Overview

The GS8182D19/37D are built in compliance with the SigmaQuad-II+ SRAM pinout standard for Separate I/O synchronous SRAMs. They are 18,874,368-bit (18Mb) SRAMs. The GS8182D19/37D SigmaQuad SRAMs are just

one element in a family of low power, low voltage HSTL I/O SRAMs designed to operate at the speeds needed to implement economical high performance networking systems.

Clocking and Addressing Schemes

The GS8182D19/37D SigmaQuad-II+ SRAMs are synchronous devices. They employ two input register clock inputs, K and \bar{K} . K and \bar{K} are independent single-ended clock inputs, not differential inputs to a single differential clock input buffer.

Each internal read and write operation in a SigmaQuad-II B4 RAM is four times wider than the device I/O bus. An input data bus de-multiplexer is used to accumulate incoming data before it is simultaneously written to the memory array. An output data multiplexer is used to capture the data produced from a single memory array read and then route it to the appropriate output drivers as needed. Therefore the address field of a SigmaQuad-II B4 RAM is always two address pins less than the advertised index depth (e.g., the 2M x 8 has a 512K addressable index).

Parameter Synopsis

	-435	-400	-375	-333	-300
t _{KHKH}	2.3 ns	2.5 ns	2.67 ns	3.3 ns	3.0 ns
t _{KHQP}	0.45 ns	0.45 ns	0.45 ns	0.45 ns	0.45 ns

\bar{CQ}	Output Echo Clock	Output	—
V _{DD}	Power Supply	Supply	1.8 V Nominal
V _{DDQ}	Isolated Output Buffer Supply	Supply	1.5 or 1.8 V Nominal
V _{SS}	Power Supply: Ground	Supply	—
QVLD	Q Valid Output	Output	—
NC	No Connect	—	—

Notes:

1. NC = Not Connected to die or any other pin
2. When ZQ pin is directly connected to V_{DDQ}, output impedance is set to minimum value and it cannot be connected to ground or left unconnected.
3. K, \bar{K} cannot be set to V_{REF} voltage

Background

Separate I/O SRAMs, from a system architecture point of view, are attractive in applications where alternating reads and writes are needed. Therefore, the SigmaQuad-II+ SRAM interface and truth table are optimized for alternating reads and writes. Separate I/O SRAMs are unpopular in applications where multiple reads or multiple writes are needed because burst read or write transfers from Separate I/O SRAMs can cut the RAM's bandwidth in half.

SigmaQuad-II+ B4 SRAM DDR Read

The status of the Address Input, \overline{W} , and \overline{R} pins are sampled by the rising edges of K. \overline{W} and \overline{R} high causes chip disable. A low on the Read Enable-bar pin, \overline{R} , begins a read cycle. \overline{R} is always ignored if the previous command loaded was a read command. . Clocking in a high on the Read Enable-bar pin, \overline{R} , begins a read port deselect cycle.

SigmaQuad-II+ B4 SRAM DDR Write

The status of the Address Input, \overline{W} , and \overline{R} pins are sampled by the rising edges of K. \overline{W} and \overline{R} high causes chip disable. A low on the Write Enable-bar pin, \overline{W} , and a high on the Read Enable-bar pin, \overline{R} , begins a write cycle. \overline{W} is always ignored if the previous command was a write command. Data is clocked in by the next rising edge of K, the rising edge of \overline{K} after that, the next rising edge of K, and finally by the next rising edge of \overline{K} . and by the rising edge of the K that follows.

Power-Up Sequence for SigmaQuad-II+ SRAMs

For compatibility across all vendors it is recommended that SigmaQuad-II+ SRAMs be powered-up in a specific sequence in order to avoid undefined operations

Power-Up Sequence

1. Power-up and maintain $\overline{\text{Doff}}$ at low state.
 - 1a. Apply V_{DD} .
 - 1b. Apply V_{DDQ} .
 - 1c. Apply V_{REF} (may also be applied at the same time as V_{DDQ}).
2. After voltages are within specification range, and clocks (K, \overline{K}) are stabilized, change $\overline{\text{Doff}}$ to high.
3. An additional 2048 clock cycles are required to lock the DLL after it has been enabled.

Note:

The DLL may be reset by driving the $\overline{\text{Doff}}$ pin low or by stopping the K clocks for at least 30ns. 2048 cycles of clean K clocks are always required to re-lock the DLL after reset.

DLL Constraints

The DLL synchronizes to either K clock. These clocks should have low phase jitter ($t_{KCV\text{ar}}$).

- The DLL cannot operate at a frequency lower than that specified by the t_{KHKH} maximum specification for the desired operating clock frequency.
- If the incoming clock is not stabilized when DLL is enabled, the DLL may lock on the wrong frequency and cause undefined errors or failures during the initial stage.

Special Functions

Byte Write Control

Byte Write Enable pins are sampled at the same time that Data In is sampled. A high on the Byte Write Enable pin associated with a particular byte (e.g., $\overline{\text{BW0}}$ controls D0–D8 inputs) will inhibit the storage of that particular byte, leaving whatever data may be stored at the current address at that byte location undisturbed. Any or all of the Byte Write Enable pins may be driven high or low during the data in sample times in a write sequence.

Each write enable command and write address loaded into the RAM provides the base address for a 4 beat data transfer. The x18 version of the RAM, for example, may write 72 bits in association with each address loaded. Any 9-bit byte may be masked in any write sequence.

Example x18 RAM Write Sequence using Byte Write Enables

Data In Sample Time	$\overline{\text{BW0}}$	$\overline{\text{BW1}}$	D0–D8	D9–D17
Beat 1	0	1	Data In	Don't Care
Beat 2	1	0	Don't Care	Data In
Beat 3	0	0	Data In	Data In
Beat 4	1	0	Don't Care	Data In

Resulting Write Operation

Byte 1 D0–D8	Byte 2 D9–D17	Byte 1 D0–D8	Byte 2 D9–D17	Byte 1 D0–D8	Byte 2 D9–D17	Byte 1 D0–D8	Byte 2 D9–D17
Written	Unchanged	Unchanged	Written	Written	Written	Unchanged	Written
Beat 1		Beat 2		Beat 3		Beat 4	

FLXDrive-II Output Driver Impedance Control

HSTL I/O SigmaQuad-II SRAMs are supplied with programmable impedance output drivers. The ZQ pin must be connected to VSS via an external resistor, RQ, to allow the SRAM to monitor and adjust its output driver impedance. The value of RQ must be 5X the value of the desired RAM output impedance. The allowable range of RQ to guarantee impedance matching continuously is between 175Ω and 350Ω. Periodic readjustment of the output driver impedance is necessary as the impedance is affected by drifts in supply voltage and temperature. The SRAM's output impedance circuitry compensates for drifts in supply voltage and temperature. A clock cycle counter periodically triggers an impedance evaluation, resets and counts again. Each impedance evaluation may move the output driver impedance level one step at a time towards the optimum level. The output driver is implemented with discrete binary weighted impedance steps.

Separate I/O SigmaQuad II+ B4 SRAM Truth Table

Previous Operation	A	\bar{R}	\bar{W}	Current Operation	D	D	D	D	Q	Q	Q	Q
$K \uparrow$ (t_{n-1})	$K \uparrow$ (t_n)	$K \uparrow$ (t_n)	$K \uparrow$ (t_n)	$K \uparrow$ (t_n)	$K \uparrow$ (t_{n+1})	$\bar{K} \uparrow$ ($t_{n+1/2}$)	$K \uparrow$ (t_{n+2})	$\bar{K} \uparrow$ ($t_{n+2/2}$)	$K \uparrow$ (t_{n+2})	$\bar{K} \uparrow$ ($t_{n+2/2}$)	$K \uparrow$ (t_{n+3})	$\bar{K} \uparrow$ ($t_{n+3/2}$)
Deselect	X	1	1	Deselect	X	X	—	—	Hi-Z	Hi-Z	—	—
Write	X	1	X	Deselect	D2	D3	—	—	Hi-Z	Hi-Z	—	—
Read	X	X	1	Deselect	X	X	—	—	Q2	Q3	—	—
Deselect	V	1	0	Write	D0	D1	D2	D3	Hi-Z	Hi-Z	—	—
Deselect	V	0	X	Read	X	X	—	—	Q0	Q1	Q2	Q3
Read	V	X	0	Write	D0	D1	D2	D3	Q2	Q3	—	—
Write	V	0	X	Read	D2	D3	—	—	Q0	Q1	Q2	Q3

Notes:

1. "1" = input "high"; "0" = input "low"; "V" = input "valid"; "X" = input "don't care"
2. "—" indicates that the input requirement or output state is determined by the next operation.
3. Q0, Q1, Q2, and Q3 indicate the first, second, third, and fourth pieces of output data transferred during Read operations.
4. D0, D1, D2, and D3 indicate the first, second, third, and fourth pieces of input data transferred during Write operations.
5. Qs are tristated for one cycle in response to Deselect and Write commands, one cycle after the command is sampled, except when preceded by a Read command.
6. Users should not clock in metastable addresses.

Byte Write Clock Truth Table

\overline{BW}	\overline{BW}	\overline{BW}	\overline{BW}	Current Operation	D	D	D	D
$K \uparrow$ (t_{n+1})	$\overline{K} \uparrow$ ($t_{n+1/2}$)	$K \uparrow$ (t_{n+2})	$\overline{K} \uparrow$ ($t_{n+2/2}$)	$K \uparrow$ (t_n)	$K \uparrow$ (t_{n+1})	$\overline{K} \uparrow$ ($t_{n+1/2}$)	$K \uparrow$ (t_{n+2})	$\overline{K} \uparrow$ ($t_{n+2/2}$)
T	T	T	T	Write Dx stored if $\overline{BWn} = 0$ in all four data transfers	D0	D2	D3	D4
T	F	F	F	Write Dx stored if $\overline{BWn} = 0$ in 1st data transfer only	D0	X	X	X
F	T	F	F	Write Dx stored if $\overline{BWn} = 0$ in 2nd data transfer only	X	D1	X	X

Absolute Maximum Ratings

(All voltages reference to V_{SS})

Symbol	Description	Value	Unit
V_{DD}	Voltage on V_{DD} Pins	-0.5 to 2.9	V
V_{DDQ}	Voltage in V_{DDQ} Pins	-0.5 to V_{DD}	V
V_{REF}	Voltage in V_{REF} Pins	-0.5 to V_{DDQ}	V
$V_{I/O}$	Voltage on I/O Pins	-0.5 to $V_{DDQ} + 0.5$ (≤ 2.9 V max.)	V
V_{IN}	Voltage on Other Input Pins	-0.5 to $V_{DDQ} + 0.5$ (≤ 2.9 V max.)	V
I_{IN}	Input Current on Any Pin	+/-100	mA dc
I_{OUT}	Output Current on Any I/O Pin	+/-100	mA dc
T_J	Maximum Junction Temperature	125	$^{\circ}$ C
T_{STG}	Storage Temperature	-55 to 125	$^{\circ}$ C

Note:

Permanent damage to the device may occur if the Absolute Maximum Ratings are exceeded. Operation should be restricted to Recommended Operating Conditions. Exposure to conditions exceeding the Recommended Operating Conditions, for an extended period of time, may affect reliability of this component.

Recommended Operating Conditions

Power Supplies

Parameter	Symbol	Min.	Typ.	Max.	Unit
Supply Voltage	V_{DD}	1.7	1.8	1.9	V
I/O Supply Voltage	V_{DDQ}	1.4	—	1.9	V
Reference Voltage	V_{REF}	0.68	—	0.95	V

Notes:

- The power supplies need to be powered up simultaneously or in the following sequence: V_{DD} , V_{DDQ} , V_{REF} , followed by signal inputs. The power down sequence must be the reverse. V_{DDQ} must not exceed V_{DD} .
- Most speed grades and configurations of this device are offered in both Commercial and Industrial Temperature ranges. The part number of Industrial Temperature Range versions end the character "I". Unless otherwise noted, all performance specifications quoted are evaluated for worst case in the temperature range marked on the device.

Operating Temperature

Parameter	Symbol	Min.	Typ.	Max.	Unit
Ambient Temperature (Commercial Range Versions)	T_A	0	25	70	$^{\circ}$ C
Ambient Temperature (Industrial Range Versions)	T_A	-40	25	85	$^{\circ}$ C

Thermal Impedance

Package	Test PCB Substrate	θ_{JA} (C°/W) Airflow = 0 m/s	θ_{JA} (C°/W) Airflow = 1 m/s	θ_{JA} (C°/W) Airflow = 2 m/s	θ_{JB} (C°/W)	θ_{JC} (C°/W)
165 BGA	4-layer	19.1	15.9	14.9	7.2	2.3

Notes:

1. Thermal Impedance data is based on a number of samples from multiple lots and should be viewed as a typical number.
2. Please refer to JEDEC standard JESD51-6.
3. The characteristics of the test fixture PCB influence reported thermal characteristics of the device. Be advised that a good thermal path to the PCB can result in cooling or heating of the RAM depending on PCB temperature.

HSTL I/O DC Input Characteristics

Parameter	Symbol	Min	Max	Units	Notes
DC Input Logic High	V_{IH} (dc)	$V_{REF} + 0.1$	$V_{DD} + 0.3$	V	1, 4
DC Input Logic Low	V_{IL} (dc)	-0.3	$V_{REF} - 0.1$	V	1, 3

Notes:

1. Compatible with both 1.8 V and 1.5 V I/O drivers
2. These are DC test criteria. DC design criteria is $V_{REF} \pm 50$ mV. The AC V_{IH}/V_{IL} levels are defined separately for measuring timing parameters.
3. V_{IL} (Min)DC = -0.3 V, V_{IL} (Min)AC = -1.5 V (pulse width ≤ 3 ns).
4. V_{IH} (Max)DC = $V_{DDQ} + 0.3$ V, V_{IH} (Max)AC = $V_{DDQ} + 0.85$ V (pulse width ≤ 3 ns).

HSTL I/O AC Input Characteristics

Parameter	Symbol	Min	Max	Units	Notes
AC Input Logic High	V_{IH} (ac)	$V_{REF} + 200$	—	mV	2, 3
AC Input Logic Low	V_{IL} (ac)	—	$V_{REF} - 200$	mV	2, 3
V_{REF} Peak to Peak AC Voltage	V_{REF} (ac)	—	5% V_{REF} (DC)	mV	1

Notes:

1. The peak to peak AC component superimposed on V_{REF} may not exceed 5% of the DC component of V_{REF} .
2. To guarantee AC characteristics, V_{IH}, V_{IL} , Trise, and Tfall of inputs and clocks must be within 10% of each other.
3. For devices supplied with HSTL I/O input buffers. Compatible with both 1.8 V and 1.5 V I/O drivers.

Undershoot Measurement and Timing

Overshoot Measurement and Timing

Capacitance

($T_A = 25^\circ\text{C}$, $f = 1\text{ MHz}$, $V_{DD} = 1.8\text{ V}$)

Parameter	Symbol	Test conditions	Typ.	Max.	Unit
Input Capacitance	C_{IN}	$V_{IN} = 0\text{ V}$	4	5	pF
Output Capacitance	C_{OUT}	$V_{OUT} = 0\text{ V}$	6	7	pF
Clock Capacitance	C_{CLK}	$V_{IN} = 0\text{ V}$	5	6	pF

Note:

This parameter is sample tested.

AC Test Conditions

Parameter	Conditions
Input high level	1.25 V
Input low level	0.25 V
Max. input slew rate	2 V/ns
Input reference level	0.75 V
Output reference level	$V_{DDQ}/2$

Note:

Test conditions as specified with output loading as shown unless otherwise noted.

AC Test Load Diagram

$R_Q = 250\ \Omega$ (HSTL I/O)
 $V_{REF} = 0.75\text{ V}$

Input and Output Leakage Characteristics

Parameter	Symbol	Test Conditions	Min.	Max	Notes
Input Leakage Current (except mode pins)	I_{IL}	$V_{IN} = 0 \text{ to } V_{DD}$	-2 μ A	2 μ A	
$\overline{\text{Doff}}$	I_{INDOFF}	$V_{DD} \geq V_{IN} \geq V_{IL}$ $0 \text{ V} \leq V_{IN} \leq V_{IL}$	-2 μ A -2 μ A	2 μ A 2 μ A	
Output Leakage Current	I_{OL}	Output Disable, $V_{OUT} = 0 \text{ to } V_{DDQ}$	-2 μ A	2 μ A	

Programmable Impedance HSTL Output Driver DC Electrical Characteristics

Parameter	Symbol	Min.	Max.	Units	Notes
Output High Voltage	V_{OH1}	$V_{DDQ}/2 - 0.12$	$V_{DDQ}/2 + 0.12$	V	1, 3
Output Low Voltage	V_{OL1}	$V_{DDQ}/2 - 0.12$	$V_{DDQ}/2 + 0.12$	V	2, 3
Output High Voltage	V_{OH2}	$V_{DDQ} - 0.2$	V_{DDQ}	V	4, 5
Output Low Voltage	V_{OL2}	V_{SS}	0.2	V	4, 6

Notes:

- $I_{OH} = (V_{DDQ}/2) / (RQ/5) \pm 15\%$ @ $V_{OH} = V_{DDQ}/2$ (for: $175\Omega \leq RQ \leq 350\Omega$).
- $I_{OL} = (V_{DDQ}/2) / (RQ/5) \pm 15\%$ @ $V_{OL} = V_{DDQ}/2$ (for: $175\Omega \leq RQ \leq 350\Omega$).
- Parameter tested with $RQ = 250\Omega$ and $V_{DDQ} = 1.5 \text{ V}$ or 1.8 V
- $0\Omega \leq RQ \leq \infty\Omega$
- $I_{OH} = -1.0 \text{ mA}$
- $I_{OL} = 1.0 \text{ mA}$

Operating Currents

Parameter	Symbol	Test Conditions	-435		-400		-375		-333		-300		Notes
			0° to 70°C	-40° to 85°C	0° to 70°C	-40° to 85°C	0° to 70°C	-40° to 85°C	0° to 70°C	-40° to 85°C	0° to 70°C	-40° to 85°C	
Operating Current (x36): DDR	I_{DD}	$V_{DD} = \text{Max}$, $I_{OUT} = 0 \text{ mA}$ Cycle Time $\geq t_{KHKH} \text{ Min}$	890 mA	900 mA	670 mA	680 mA	635 mA	645 mA	575 mA	585 mA	535 mA	545 mA	2, 3
Operating Current (x18): DDR	I_{DD}	$V_{DD} = \text{Max}$, $I_{OUT} = 0 \text{ mA}$ Cycle Time $\geq t_{KHKH} \text{ Min}$	770 mA	780 mA	605 mA	615 mA	570 mA	580 mA	525 mA	535 mA	490 mA	500 mA	2, 3
Standby Current (NOP): DDR	I_{SB1}	Device deselected, $I_{OUT} = 0 \text{ mA}$, $f = \text{Max}$, All Inputs $\leq 0.2 \text{ V}$ or $\geq V_{DD} - 0.2 \text{ V}$	190 mA	200 mA	175 mA	185 mA	170 mA	180 mA	160 mA	170 mA	155 mA	165 mA	2, 4

Notes:

1. Power measured with output pins floating.
2. Minimum cycle, $I_{OUT} = 0 \text{ mA}$
3. Operating current is calculated with 50% read cycles and 50% write cycles.
4. Standby Current is only after all pending read and write burst operations are completed.

Data Input Setup Time	t_{DVKH}	0.28	—	0.28	—	0.28	—	0.28	—	0.28	—	ns	

Notes:

- All Address inputs must meet the specified setup and hold times for all latching clock edges.
- Control singles are R, W,
- Control singles are BW₀, BW₁ and ($\overline{BW_2}$, $\overline{BW_3}$ for x36).
- Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.
- To avoid bus contention, at a given voltage and temperature t_{CHQX1} is bigger than t_{CHQZ} . The specs as shown do not imply bus contention because t_{CHQX1} is a MIN parameter that is worst case at totally different test conditions (0°C, 1.9 V) than t_{CHQZ} , which is a MAX parameter (worst case at 70°C, 1.7 V). It is not possible for two SRAMs on the same board to be at such different voltages and temperatures.
- V_{DD} slew rate must be less than 0.1 V DC per 50 ns for DLL lock retention. DLL lock time begins once V_{DD} and input clock are stable.
- Echo clock is very tightly controlled to data valid/data hold. By design, there is a ± 0.1 ns variation from echo clock to data. The datasheet parameters reflect tester guard bands and test setup variations.

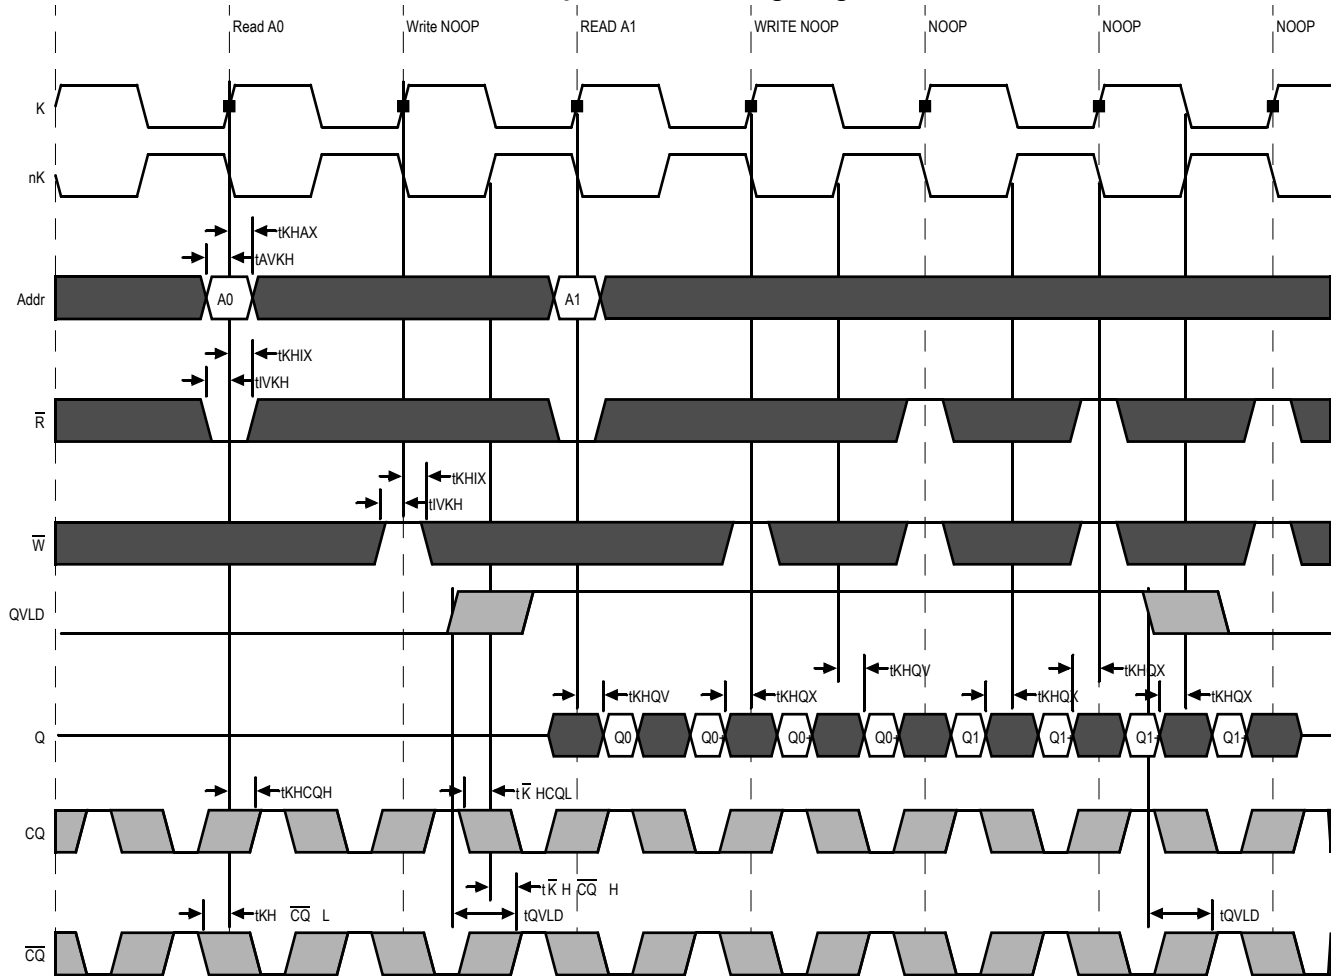

AC Electrical Characteristics (Continued)

Parameter	Symbol	-435		-400		-375		-333		-300		Units	Notes
		Min	Max	Min	Max	Min	Max	Min	Max	Min	Max		
Hold Times

JTAG Port Operation

Overview

The JTAG Port on this RAM operates in a manner that is compliant with IEEE Standard 1149.1-1990, a serial boundary scan interface standard (commonly referred to as JTAG). The JTAG Port input interface levels scale with V_{DD} . The JTAG output drivers are powered by V_{DD} .

Disabling the JTAG Port

It is possible to use this device without utilizing the JTAG port. The port is reset at power-up and will remain inactive unless clocked. TCK, TDI, and TMS are designed with internal pull-up circuits. To assure normal operation of the RAM with the JTAG Port unused, TCK, TDI, and TMS may be left floating or tied to either V_{DD} or V_{SS} . TDO should be left unconnected.

JTAG Pin Descriptions

Pin	Pin Name	I/O	Description
TCK	Test Clock	In	Clocks all TAP events. All inputs are captured on the rising edge of TCK and all outputs propagate from the falling edge of TCK.
TMS	Test Mode Select	In	The TMS input is sampled on the rising edge of TCK. This is the command input for the TAP controller state machine. An undriven TMS input will produce the same result as a logic one input level.
TDI	Test Data In	In	The TDI input is sampled on the rising edge of TCK. This is the input side of the serial registers placed between TDI and TDO. The register placed between TDI and TDO is determined by the state of the TAP Controller state machine and the instruction that is currently loaded in the TAP Instruction Register (refer to the TAP Controller State Diagram). An undriven TDI pin will produce the same result as a logic one input level.
TDO	Test Data Out	Out	Output that is active depending on the state of the TAP state machine. Output changes in response to the falling edge of TCK. This is the output side of the serial registers placed between TDI and TDO.

Note:

This device does not have a TRST (TAP Reset) pin. TRST is optional in IEEE 1149.1. The Test-Logic-Reset state is entered while TMS is held high for five rising edges of TCK. The TAP Controller is also reset automatically at power-up.

JTAG Port Registers

Overview

The various JTAG registers, referred to as Test Access Port or TAP Registers, are selected (one at a time) via the sequences of 1s and 0s applied to TMS as TCK is strobed. Each of the TAP Registers is a serial shift register that captures serial input data on the rising edge of TCK and pushes serial data out on the next falling edge of TCK. When a register is selected, it is placed between the TDI and TDO pins.

Instruction Register

The Instruction Register holds the instructions that are executed by the TAP controller when it is moved into the Run, Test/Idle, or the various data register states. Instructions are 3 bits long. The Instruction Register can be loaded when it is placed between the TDI and TDO pins. The Instruction Register is automatically preloaded with the IDCODE instruction at power-up or whenever the controller is placed in Test-Logic-Reset state.

Bypass Register

The Bypass Register is a single bit register that can be placed between TDI and TDO. It allows serial test data to be passed through the RAM's JTAG Port to another device in the scan chain with as little delay as possible.

Boundary Scan Register

The Boundary Scan Register is a collection of flip flops that can be preset by the logic level found on the RAM's input or I/O pins. The flip flops are then daisy chained together so the levels found can be shifted serially out of the JTAG Port's TDO pin. The Boundary Scan Register also includes a number of place holder flip flops (always set to a logic 1). The relationship between the device pins and the bits in the Boundary Scan Register is described in the Scan Order Table following. The Boundary Scan

Register, under the control of the TAP Controller, is loaded with the contents of the RAMs I/O ring when the controller is in Capture-DR state and then is placed between the TDI and TDO pins when the controller is moved to Shift-DR state. SAMPLE-Z, SAMPLE/PRELOAD and EXTEST instructions can be used to activate the Boundary Scan Register.

JTAG TAP Block Diagram

Identification (ID) Register

The ID Register is a 32-bit register that is loaded with a device and vendor specific 32-bit code when the controller is put in Capture-DR state with the IDCODE command loaded in the Instruction Register. The code is loaded from a 32-bit on-chip ROM. It describes various attributes of the RAM as indicated below. The register is then placed between the TDI and TDO pins when the controller is moved into Shift-DR state. Bit 0 in the register is the LSB and the first to reach TDO when shifting begins.

ID Register Contents

Not Used																GSI Technology JEDEC Vendor ID Code						Presence Register										
Bit #	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	0	0	0	1	1	0	1	1	0	0	1	1

Tap Controller Instruction Set

Overview

There are two classes of instructions defined in the Standard 1149.1-1990; the standard (Public) instructions, and device specific (Private) instructions. Some Public instructions are mandatory for 1149.1 compliance. Optional Public instructions must be implemented in prescribed ways. The TAP on this device may be used to monitor all input and I/O pads, and can be used to load address, data or control signals into the RAM or to preload the I/O buffers.

When the TAP controller is placed in Capture-IR state the two least significant bits of the instruction register are loaded with 01. When the controller is moved to the Shift-IR state the Instruction Register is placed between TDI and TDO. In this state the desired instruction is serially loaded through the TDI input (while the previous contents are shifted out at TDO). For all instructions, the TAP executes newly loaded instructions only when the controller is moved to Update-IR state. The TAP instruction set for this device is listed in the following table.

JTAG Tap Controller State Diagram

Instruction Descriptions

BYPASS

When the BYPASS instruction is loaded in the Instruction Register the Bypass Register is placed between TDI and TDO. This occurs when the TAP controller is moved to the Shift-DR state. This allows the board level scan path to be shortened to facilitate testing of other devices in the scan path.

SAMPLE/PRELOAD

SAMPLE/PRELOAD is a Standard 1149.1 mandatory public instruction. When the SAMPLE / PRELOAD instruction is

loaded in the Instruction Register, moving the TAP controller into the Capture-DR state loads the data in the RAMs input and I/O buffers into the Boundary Scan Register. Boundary Scan Register locations are not associated with an input or I/O pin, and are loaded with the default state identified in the Boundary Scan Chain table at the end of this section of the datasheet. Because the RAM clock is independent from the TAP Clock (TCK) it is possible for the TAP to attempt to capture the I/O ring contents while the input buffers are in transition (i.e. in a metastable state). Although allowing the TAP to sample metastable inputs will not harm the device, repeatable results cannot be expected. RAM input signals must be stabilized for long enough to meet the TAPs input data capture set-up plus hold time (tTS plus tTH). The RAMs clock inputs need not be paused for any other TAP operation except capturing the I/O ring contents into the Boundary Scan Register. Moving the controller to Shift-DR state then places the boundary scan register between the TDI and TDO pins.

EXTEST

EXTEST is an IEEE 1149.1 mandatory public instruction. It is to be executed whenever the instruction register is loaded with all logic 0s. The EXTEST command does not block or override the RAM's input pins; therefore, the RAM's internal state is still determined by its input pins.

Typically, the Boundary Scan Register is loaded with the desired pattern of data with the SAMPLE/PRELOAD command. Then the EXTEST command is used to output the Boundary Scan Register's contents, in parallel, on the RAM's data output drivers on the falling edge of TCK when the controller is in the Update-IR state.

Alternately, the Boundary Scan Register may be loaded in parallel using the EXTEST command. When the EXTEST instruction is selected, the state of all the RAM's input and I/O pins, as well as the default values at Scan Register locations not associated with a pin, are transferred in parallel into the Boundary Scan Register on the rising edge of TCK in the Capture-DR state, the RAM's output pins drive out the value of the Boundary Scan Register location with which each output pin is associated.

IDCODE

The IDCODE instruction causes the ID ROM to be loaded into the ID register when the controller is in Capture-DR mode and places the ID register between the TDI and TDO pins in Shift-DR mode. The IDCODE instruction is the default instruction loaded in at power up and any time the controller is placed in the Test-Logic-Reset state.

SAMPLE-Z

If the SAMPLE-Z instruction is loaded in the instruction register, all RAM outputs are forced to an inactive drive state (high-Z) and the Boundary Scan Register is connected between TDI and TDO when the TAP controller is moved to the Shift-DR state.

RFU

These instructions are Reserved for Future Use. In this device they replicate the BYPASS instruction.

JTAG TAP Instruction Set Summary

Instruction	Code	Description	Notes
EXTEST	000	Places the Boundary Scan Register between TDI and TDO.	1
IDCODE	001	Preloads ID Register and places it between TDI and TDO.	1, 2
SAMPLE-Z	010	Captures I/O ring contents. Places the Boundary Scan Register between TDI and TDO. Forces all RAM output drivers to High-Z except CQ.	1
RFU	011	Do not use this instruction; Reserved for Future Use. Replicates BYPASS instruction. Places Bypass Register between TDI and TDO.	1

JTAG TAP Instruction Set Summary

SAMPLE/ PRELOAD	100	Captures I/O ring contents. Places the Boundary Scan Register between TDI and TDO.	1
GSI	101	GSI private instruction.	1
RFU	110	Do not use this instruction; Reserved for Future Use. Replicates BYPASS instruction. Places Bypass Register between TDI and TDO.	1
BYPASS	111	Places Bypass Register between TDI and TDO.	1

Notes:

1. Instruction codes expressed in binary, MSB on left, LSB on right.
2. Default instruction automatically loaded at power-up and in test-logic-reset state.

JTAG Port Recommended Operating Conditions and DC Characteristics

Parameter	Symbol	Min.	Max.	Unit	Notes
Test Port Input Low Voltage	V_{ILJ}	-0.3	$0.3 * V_{DD}$	V	1
Test Port Input High Voltage	V_{IHJ}	$0.6 * V_{DD}$	$V_{DD} + 0.3$	V	1
TMS, TCK and TDI Input Leakage Current	I_{INHJ}	-300	1	μA	2
TMS, TCK and TDI Input Leakage Current	I_{INLJ}	-1	100	μA	3
TDO Output Leakage Current	I_{OLJ}	-1	1	μA	4
Test Port Output High Voltage	V_{OHJ}	$V_{DD} - 200$ mV	—	V	5, 6
Test Port Output Low Voltage	V_{OLJ}	—	0.4	V	5, 7
Test Port Output CMOS High	V_{OHJC}	$V_{DD} - 100$ mV	—	V	5, 8
Test Port Output CMOS Low	V_{OLJC}	—	100 mV	V	5, 9

Notes:

1. Input Under/overshoot voltage must be $-1 V < V_i < V_{DDn} + 1 V$ not to exceed 2.9 V maximum, with a pulse width not to exceed 20% t_{TKC} .
2. $V_{ILJ} \leq V_{IN} \leq V_{DDn}$
3. $0 V \leq V_{IN} \leq V_{ILJn}$
4. Output Disable, $V_{OUT} = 0$ to V_{DDn}
5. The TDO output driver is served by the V_{DD} supply.
6. $I_{OHJ} = -2$ mA
7. $I_{OLJ} = +2$ mA
8. $I_{OHJC} = -100$ μA
9. $I_{OLJC} = +100$ μA

JTAG Port AC Test Conditions

Parameter	Conditions
Input high level	$V_{DD} - 0.2 V$
Input low level	0.2 V
Input slew rate	1 V/ns
Input reference level	$V_{DD}/2$
Output reference level	$V_{DD}/2$

Notes:

1. Include scope and jig capacitance.
2. Test conditions as shown unless otherwise noted.
