## 9Mb Pipelined and Flow Through Synchronous NBT SRAM

**250 MHz–150 MHz**  
**1.8 V or 2.5 V V<sub>DD</sub>**  
**1.8 V or 2.5 V I/O**

### Features

- NBT (No Bus Turn Around) functionality allows zero wait read-write-read bus utilization; Fully pin-compatible with both pipelined and flow through NtRAM™, NoBL™ and ZBT™ SRAMs
- 1.8 V or 2.5 V +10%/–10% core power supply
- 1.8 V or 2.5 V I/O supply
- User-configurable Pipeline and Flow Through mode
- $\overline{\text{LBO}}$  pin for Linear or Interleave Burst mode
- Pin compatible with 2M, 4M, and 18M devices
- Byte write operation (9-bit Bytes)
- 3 chip enable signals for easy depth expansion
- ZZ Pin for automatic power-down
- JEDEC-standard 100-lead TQFP package
- RoHS-compliant 100-lead TQFP package available

### Functional Description

The GS880Z18/32/36CT-xxxV is a 9Mbit Synchronous Static SRAM. GSI's NBT SRAMs, like ZBT, NtRAM, NoBL or other pipelined read/double late write or flow through read/single late write SRAMs, allow utilization of all available bus bandwidth by eliminating the need to insert deselect cycles when the device is switched from read to write cycles.

Because it is a synchronous device, address, data inputs, and read/ write control inputs are captured on the rising edge of the input clock. Burst order control ( $\overline{\text{LBO}}$ ) must be tied to a power

rail for proper operation. Asynchronous inputs include the Sleep mode enable (ZZ) and Output Enable. Output Enable can be used to override the synchronous control of the output drivers and turn the RAM's output drivers off at any time. Write cycles are internally self-timed and initiated by the rising edge of the clock input. This feature eliminates complex off-chip write pulse generation required by asynchronous SRAMs and simplifies input signal timing.

The GS880Z18/32/36CT-xxxV may be configured by the user to operate in Pipeline or Flow Through mode. Operating as a pipelined synchronous device, meaning that in addition to the rising edge triggered registers that capture input signals, the device incorporates a rising-edge-triggered output register. For read cycles, pipelined SRAM output data is temporarily stored by the edge triggered output register during the access cycle and then released to the output drivers at the next rising edge of clock.

The GS880Z18/32/36CT-xxxV is implemented with GSI's high performance CMOS technology and is available in a JEDEC-standard 100-pin TQFP package.

### Parameter Synopsis

		-250	-200	-150	Unit
Pipeline 3-1-1-1	$t_{kQ}$	3.0	3.0	3.8	ns
	tCycle	4.0	5.0	6.7	ns
	Curr (x18)	175	150	125	mA
	Curr (x32/x36)	200	165	145	mA
Flow Through 2-1-1-1	$t_{kQ}$	5.5	6.5	7.5	ns
	tCycle	5.5	6.5	7.5	ns
	Curr (x18)	135	125	113	mA
	Curr (x32/x36)	155	140	125	mA

GS880Z18CT-xxxV 100-Pin TQFP Pinout (Package T)

**Note:**

Pins marked with NC can be tied to either  $V_{DD}$  or  $V_{SS}$ . These pins can also be left floating.

GS880Z32CT-xxxV 100-Pin TQFP Pinout (Package T)

**Note:**

Pins marked with NC can be tied to either  $V_{DD}$  or  $V_{SS}$ . These pins can also be left floating.

GS880Z36CT-xxxV 100-Pin TQFP Pinout (Package T)

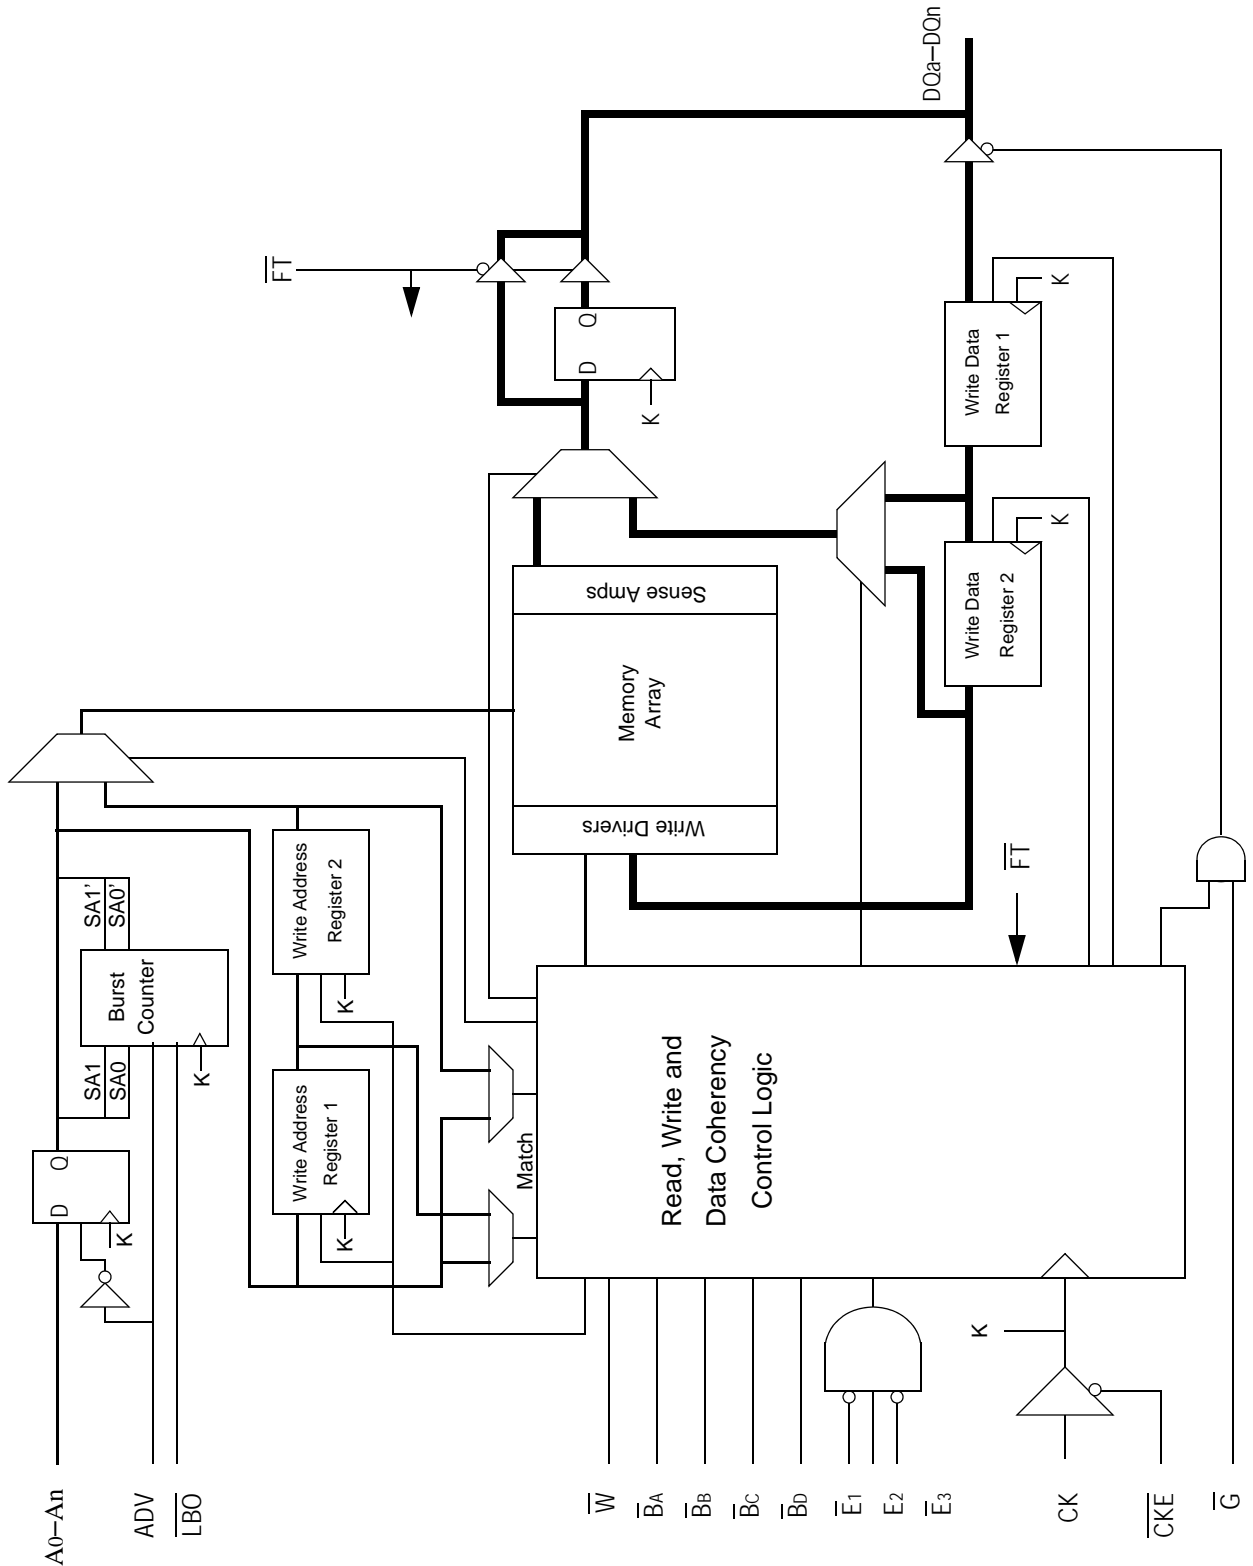

**Note:**  
Pins marked with NC can be tied to either V<sub>DD</sub> or V<sub>SS</sub>. These pins can also be left floating.

## 100-Pin TQFP Pin Descriptions

Symbol	Type	Description
A <sub>0</sub> , A <sub>1</sub>	In	Burst Address Inputs; Preload the burst counter
A	In	Address Inputs
CK	In	Clock Input Signal
$\overline{B}A$	In	Byte Write signal for data inputs DQ <sub>A</sub> ; active low
$\overline{B}B$	In	Byte Write signal for data inputs DQ <sub>B</sub> ; active low
$\overline{B}C$	In	Byte Write signal for data inputs DQ <sub>C</sub> ; active low

## GS880Z18/32/36CT-xxxV NBT SRAM Functional Block Diagram

## Functional Details

### Clocking

Deassertion of the Clock Enable ( $\overline{\text{CKE}}$ ) input blocks the Clock input from reaching the RAM's internal circuits. It may be used to suspend RAM operations. Failure to observe Clock Enable set-up or hold requirements will result in erratic operation.

### Pipeline Mode Read and Write Operations

All inputs (with the exception of Output Enable, Linear Burst Order and Sleep) are synchronized to rising clock edges. Single cycle read and write operations must be initiated with the Advance/Load pin (ADV) held low, in order to load the new address. Device activation is accomplished by asserting all three of the Chip Enable inputs ( $\overline{\text{E}}_1$ ,  $\text{E}_2$  and  $\overline{\text{E}}_3$ ). Deassertion of any one of the Enable inputs will deactivate the device.

Function	$\overline{\text{W}}$	$\overline{\text{B}}_A$	$\overline{\text{B}}_B$	$\overline{\text{B}}_C$	$\overline{\text{B}}_D$
Read	H	X	X	X	X
Write Byte "a"	L	L	H	H	H
Write Byte "b"	L	H	L	H	H
Write Byte "c"	L	H	H	L	H
Write Byte "d"	L	H	H	H	L
Write all Bytes	L	L	L	L	L
Write Abort/NOP	L	H	H	H	H

Read operation is initiated when the following conditions are satisfied at the rising edge of clock:  $\overline{\text{CKE}}$  is asserted Low, all three chip enables ( $\overline{\text{E}}_1$ ,  $\text{E}_2$ , and  $\overline{\text{E}}_3$ ) are active, the write enable input signals  $\overline{\text{W}}$  is deasserted high, and ADV is asserted low. The address presented to the address inputs is latched in to address register and presented to the memory core and control logic. The control logic determines that a read access is in progress and allows the requested data to propagate to the input of the output register. At the next rising edge of clock the read data is allowed to propagate through the output register and onto the output pins.

Write operation occurs when the RAM is selected, CKE is active, and the Write input is sampled low at the rising edge of clock. The Byte Write Enable inputs ( $\overline{\text{B}}_A$ ,  $\overline{\text{B}}_B$ ,  $\overline{\text{B}}_C$ , &  $\overline{\text{B}}_D$ ) determine which bytes will be written. All or none may be activated. A write cycle with no Byte Write inputs active is a no-op cycle. The pipelined NBT SRAM provides double late write functionality, matching the write command versus data pipeline length (2 cycles) to the read command versus data pipeline length (2 cycles). At the first rising edge of clock, Enable, Write, Byte Write(s), and Address are registered. The Data In associated with that address is required at the third rising edge of clock.

### Flow Through Mode Read and Write Operations

Operation of the RAM in Flow Through mode is very similar to operations in Pipeline mode. Activation of a Read Cycle and the use of the Burst Address Counter is identical. In Flow Through mode the device may begin driving out new data immediately after new address are clocked into the RAM, rather than holding new data until the following (second) clock edge. Therefore, in Flow Through mode the read pipeline is one cycle shorter than in Pipeline mode.

Write operations are initiated in the same way, but differ in that the write pipeline is one cycle shorter as well, preserving the ability to turn the bus from reads to writes without inserting any dead cycles. While the pipelined NBT RAMs implement a double late write protocol, in Flow Through mode a single late write protocol mode is observed. Therefore, in Flow Through mode, address and control are registered on the first rising edge of clock and data in is required at the data input pins at the second rising edge of clock.

### Synchronous Truth Table

Operation	Type	Address	CK	$\overline{\text{CKE}}$	ADV	$\overline{\text{W}}$	$\overline{\text{Bx}}$	$\overline{\text{E1}}$	E2	$\overline{\text{E3}}$	$\overline{\text{G}}$	ZZ	DQ	Notes
Read Cycle, Begin Burst	R	External	L-H	L	L	H	X	L	H	L	L	L	Q	
Read Cycle, Continue Burst	B	Next	L-H	L	H	X	X	X	X	X	L	L	Q	1,10
NOP/Read, Begin Burst	R	External	L-H	L	L	H	X	L	H	L	H	L	High-Z	2
Dummy Read, Continue Burst	B	Next	L-H	L	H	X	X	X	X	X	H	L	High-Z	1,2,10
Write Cycle, Begin Burst	W	External	L-H	L	L	L	L	L	H	L	X	L	D	3
Write Abort, Begin Burst	D	None	L-H	L	L	L	H	L	H	L	X	L	High-Z	1

Deselect Cycle, Power Down	D	None	L-H	L	L	X	X	X	X	H	X	L	High-Z	
Deselect Cycle, Power Down	D	None	L-H	L	L	X	X	X	L	X	X	L	High-Z	
Deselect Cycle, Continue	D	None	L-H	L	H	X	X	X	X	X	X	L	High-Z	1
Sleep Mode		None	X	X	X	X	X	X	X	X	X	H	High-Z	
Clock Edge Ignore, Stall		Current	L-H	H	X	X	X	X	X	X	X	L	-	4

#### Notes:

- Continue Burst cycles, whether read or write, use the same control inputs. A Deselect continue cycle can only be entered into if a Deselect cycle is executed first.
- Dummy Read and Write abort can be considered NOPs because the SRAM performs no operation. A Write abort occurs when the  $\overline{\text{W}}$  pin is sampled low but no Byte Write pins are active so no write operation is performed.
- $\overline{\text{G}}$  can be wired low to minimize the number of control signals provided to the SRAM. Output drivers will automatically turn off during write cycles.
- If  $\overline{\text{CKE}}$  High occurs during a pipelined read cycle, the DQ bus will remain active (Low Z). If  $\overline{\text{CKE}}$  High occurs during a write cycle, the bus will remain in High Z.
- X = Don't Care; H = Logic High; L = Logic Low;  $\overline{\text{Bx}}$  = High = All Byte Write signals are high;  $\overline{\text{Bx}}$  = Low = One or more Byte/Write signals are Low
- All inputs, except  $\overline{\text{G}}$  and ZZ must meet setup and hold times of rising clock edge.
- Wait states can be inserted by setting  $\overline{\text{CKE}}$  high.
- This device contains circuitry that ensures all outputs are in High Z during power-up.
- A 2-bit burst counter is incorporated.
- The address counter is incremented for all Burst continue cycles.

## Pipeline and Flow Through Read Write Control State Diagram

**Key**

**Notes:**

1. The Hold command ( $\overline{\text{CKE}}$  Low) is not shown because it prevents any state change.
2. W, R, B and D represent input command codes, as indicated in the Synchronous Truth Table.

### Burst Cycles

Although NBT RAMs are designed to sustain 100% bus bandwidth by eliminating turnaround cycle when there is transition from read to write, multiple back-to-back reads or writes may also be performed. NBT SRAMs provide an on-chip burst address generator that can be utilized, if desired, to further simplify burst read or write implementations. The ADV control pin, when driven high, commands the SRAM to advance the internal address counter and use the counter generated address to read or write the SRAM. The starting address for the first cycle in a burst cycle series is loaded into the SRAM by driving the ADV pin low, into Load mode.

### Burst Order

The burst address counter wraps around to its initial state after four addresses (the loaded address and three more) have been accessed. The burst sequence is determined by the state of the Linear Burst Order pin ( $\overline{\text{LBO}}$ ). When this pin is low, a linear burst sequence is selected. When the RAM is installed with the LBO pin tied high, Interleaved burst sequence is selected. See the tables below for details.

### Mode Pin Functions

Mode Name	Pin Name	State	Function
Burst Order Control	$\overline{\text{LBO}}$	L	Linear Burst
		H	Interleaved Burst
Output Register Control	$\overline{\text{FT}}$	L	Flow Through
		H or NC	Pipeline
Power Down Control	ZZ	L or NC	Active
		H	Standby, $I_{DD} = I_{SB}$

#### Note:

There is a pull-up device on the  $\overline{\text{FT}}$  pin and a pull-down device on the ZZ pin, so this input pin can be unconnected and the chip will operate in the default states as specified in the above tables.

### Burst Counter Sequences

#### Linear Burst Sequence

	A[1:0]	A[1:0]	A[1:0]	A[1:0]
1st address	00	01	10	11
2nd address	01	10	11	00
3rd address	10	11	00	01
4th address	11	00	01	10

#### Note:

The burst counter wraps to initial state on the 5th clock.

#### Interleaved Burst Sequence

	A[1:0]	A[1:0]	A[1:0]	A[1:0]
1st address	00	01	10	11
2nd address	01	00	11	10
3rd address	10	11	00	01
4th address	11	10	01	00

#### Note:

The burst counter wraps to initial state on the 5th clock.

### Sleep Mode

During normal operation, ZZ must be pulled low, either by the user or by its internal pull down resistor. When ZZ is pulled high, the SRAM will enter a Power Sleep mode after 2 cycles. At this time, internal state of the SRAM is preserved. When ZZ returns to low, the SRAM operates normally after ZZ recovery time.

Sleep mode is a low current, power-down mode in which the device is deselected and current is reduced to  $I_{SB2}$ . The duration of Sleep mode is dictated by the length of time the ZZ is in a high state. After entering Sleep mode, all inputs except ZZ become disabled and all outputs go to High-Z. The ZZ pin is an asynchronous, active high input that causes the device to enter Sleep mode. When the ZZ pin is driven high,  $I_{SB2}$  is guaranteed after the time  $t_{ZZI}$  is met. Because ZZ is an asynchronous input, pending operations or operations in progress may not be properly completed if ZZ is asserted. Therefore, Sleep mode must not be initiated until valid pending operations are completed. Similarly, when exiting Sleep mode during  $t_{ZZR}$ , only a deselect or read commands may be applied while the SRAM is recovering from Sleep mode.

#### Sleep Mode Timing Diagram

### Designing for Compatibility

The GSI NBT SRAMs offer users a configurable selection between Flow Through mode and Pipeline mode via the  $\overline{FT}$  signal found on Pin 14. Not all vendors offer this option, however most mark Pin 14 as  $V_{DD}$  or  $V_{DDQ}$  on pipelined parts and  $V_{SS}$  on flow through parts. GSI NBT SRAMs are fully compatible with these sockets.

## Absolute Maximum Ratings

(All voltages reference to  $V_{SS}$ )

Symbol	Description	Value	Unit
$V_{DD}$	Voltage on $V_{DD}$ Pins	-0.5 to 4.6	V
$V_{DDQ}$	Voltage on $V_{DDQ}$ Pins	-0.5 to $V_{DD}$	V
$V_{I/O1}$	Voltage on I/O Pins	-0.5 to $V_{DD} + 0.5$ ( $\leq 4.6$ V max.)	V
$V_{I/O2}$	Voltage on I/O Pins	-0.5 to $V_{DDQ} + 0.5$ ( $\leq 4.6$ V max.)	V
$V_{IN}$	Voltage on Other Input Pins	-0.5 to $V_{DD} + 0.5$ ( $\leq 4.6$ V max.)	V
$I_{IN}$	Input Current on Any Pin	+/-20	mA
$I_{OUT}$	Output Current on Any I/O Pin	+/-20	mA
$P_D$	Package Power Dissipation	1.5	W
$T_{STG}$	Storage Temperature	-55 to 125	$^{\circ}C$
$T_{BIAS}$	Temperature Under Bias	-55 to 125	$^{\circ}C$

### Notes:

- Permanent damage to the device may occur if the Absolute Maximum Ratings are exceeded. Operation should be restricted to Recommended Operating Conditions. Exposure to conditions exceeding the Absolute Maximum Ratings, for an extended period of time, may affect reliability of this component.
- Both  $V_{I/O1}$  and  $V_{I/O2}$  must be met.

## Power Supply Voltage Ranges (1.8 V/2.5 V Version)

Parameter	Symbol	Min.	Typ.	Max.	Unit
1.8 V Supply Voltage	$V_{DD1}$	1.7	1.8	2.0	V
2.5 V Supply Voltage	$V_{DD2}$	2.3	2.5	2.7	V
1.8 V $V_{DDQ}$ I/O Supply Voltage	$V_{DDQ1}$	1.7	1.8	$V_{DD}$	V
2.5 V $V_{DDQ}$ I/O Supply Voltage	$V_{DDQ2}$	2.3	2.5	$V_{DD}$	V

### Note:

$V_{DDQ}$  must be less than or equal to  $V_{DD} + 0.3$  V at all times.

**$V_{DDQ2}$  &  $V_{DDQ1}$  Range Logic Levels**

Parameter	Symbol	Min.	Typ.	Max.	Unit
$V_{DD}$ Input High Voltage	$V_{IH}$	$0.6 \cdot V_{DD}$	—	$V_{DD} + 0.3$	V
$V_{DD}$ Input High Voltage	$V_{IH(I/O)1}$	$0.6 \cdot V_{DD}$	—	$V_{DD} + 0.3$	V
$V_{DD}$ Input High Voltage	$V_{IH(I/O)2}$	$0.6 \cdot V_{DD}$	—	$V_{DDQ} + 0.3$	V
$V_{DD}$ Input Low Voltage	$V_{IL}$	-0.3	—	$0.3 \cdot V_{DD}$	V

**Notes:**

- $V_{IH}$  (max) must be met for any instantaneous value of  $V_{DD}$ .
- $V_{IH(I/O)1}$  (max) must be met for any instantaneous value of  $V_{DD}$ .
- $V_{IH(I/O)2}$  (max) must be met for any instantaneous value of  $V_{DDQ}$ .
- $V_{DD}$  needs to power-up before or at the same time as  $V_{DDQ}$  to make sure  $V_{IH}$  (max) is not exceeded.

**Recommended Operating Temperatures**

Parameter	Symbol	Min.	Typ.	Max.	Unit
Ambient Temperature (Commercial Range Versions)	$T_A$	0	25	70	°C

**Note:**

Unless otherwise noted, all performance specifications quoted are evaluated for worst case in the temperature range marked on the device.

**Thermal Impedance**

Package	Test PCB Substrate	$\theta_{JA}$ (C°/W) Airflow = 0 m/s	$\theta_{JA}$ (C°/W) Airflow = 1 m/s	$\theta_{JA}$ (C°/W) Airflow = 2 m/s	$\theta_{JB}$ (C°/W)	$\theta_{JC}$ (C°/W)
100 TQFP	4-layer	38.7	33.5	31.9	27.6	10.6

**Notes:**

- Thermal Impedance data is based on a number of samples from multiple lots and should be viewed as a typical number.
- Please refer to JEDEC standard JESD51-6.
- The characteristics of the test fixture PCB influence reported thermal characteristics of the device. Be advised that a good thermal path to the PCB can result in cooling or heating of the RAM depending on PCB temperature.

### Undershoot Measurement and Timing

### Overshoot Measurement and Timing

**Note:**

Input Under/overshoot voltage must be  $-2\text{ V} > V_i < V_{DDn} + 2\text{ V}$  not to exceed 4.6 V maximum, with a pulse width not to exceed 20% t<sub>KC</sub>.

### Capacitance

(T<sub>A</sub> = 25°C, f = 1 MHz, V<sub>DD</sub> = 2.5 V)

Parameter	Symbol	Test conditions	Typ.	Max.	Unit
Input Capacitance	C <sub>IN</sub>	V <sub>IN</sub> = 0 V	8	10	pF
Input/Output Capacitance	C <sub>I/O</sub>	V <sub>OUT</sub> = 0 V	12	14	pF

**Note:**

These parameters are sample tested.

### AC Test Conditions

Parameter	Conditions
Input high level	V <sub>DD</sub> - 0.2 V
Input low level	0.2 V
Input slew rate	1 V/ns
Input reference level	V <sub>DD</sub> /2
Output reference level	V <sub>DDQ</sub> /2
Output load	Fig. 1

**Notes:**

1. Include scope and jig capacitance.
2. Test conditions as specified with output loading as shown in Fig. 1 unless otherwise noted.
3. Device is deselected as defined by the Truth Table.

**Figure 1**

## DC Electrical Characteristics

Parameter	Symbol	Test Conditions	Min	Max
Input Leakage Current (except mode pins)	$I_{IL}$	$V_{IN} = 0 \text{ to } V_{DD}$	-1 $\mu\text{A}$	1 $\mu\text{A}$
$\overline{FT}$ Input Current	$I_{IN}$	$V_{DD} \geq V_{IN} \geq 0 \text{ V}$	-100 $\mu\text{A}$	100 $\mu\text{A}$
Output Leakage Current	$I_{OL}$	Output Disable, $V_{OUT} = 0 \text{ to } V_{DD}$	-1 $\mu\text{A}$	1 $\mu\text{A}$
1.8 V Output High Voltage	$V_{OH1}$	$I_{OH} = -4 \text{ mA}$ , $V_{DDQ} = 1.7 \text{ V}$	$V_{DDQ} - 0.4 \text{ V}$	—
2.5 V Output High Voltage	$V_{OH2}$	$I_{OH} = -8 \text{ mA}$ , $V_{DDQ} = 2.375 \text{ V}$	1.7 V	—
1.8 V Output Low Voltage	$V_{OL1}$	$I_{OL} = 4 \text{ mA}$	—	0.4 V
2.5 V Output Low Voltage	$V_{OL2}$	$I_{OL} = 8 \text{ mA}$	—	0.4 V

## Operating Currents

Parameter	Test Conditions	Mode	Symbol	-250	-200	-150	Unit
				0 to 70°C	0 to 70°C	0 to 70°C	
Operating Current	Device Selected; All other inputs $\geq V_{IH}$ or $\leq V_{IL}$ Output open	(x32/x36)	Pipeline	$I_{DD}$ 180	150	125	mA
			Flow Through	$I_{DDQ}$ 20	15	20	
		(x18)	Pipeline	$I_{DD}$ 140	125	110	mA
			Flow Through	$I_{DDQ}$ 15	15	15	
Standby Current	$ZZ \geq V_{DD} - 0.2 V$	—	Pipeline	$I_{SB}$ 25	25	25	mA
			Flow Through	$I_{SB}$ 25	25	25	
Deselect Current	Device Deselected; All other inputs $\geq V_{IH}$ or $\leq V_{IL}$	—	Pipeline	$I_{DD}$ 45	45	40	mA
			Flow Through	$I_{DD}$ 40	40	40	

## Notes:

- $I_{DD}$  and  $I_{DDQ}$  apply to any combination of  $V_{DD1}$ ,  $V_{DD2}$ ,  $V_{DDQ1}$ , and  $V_{DDQ2}$  operation.
- All parameters listed are worst case scenario.

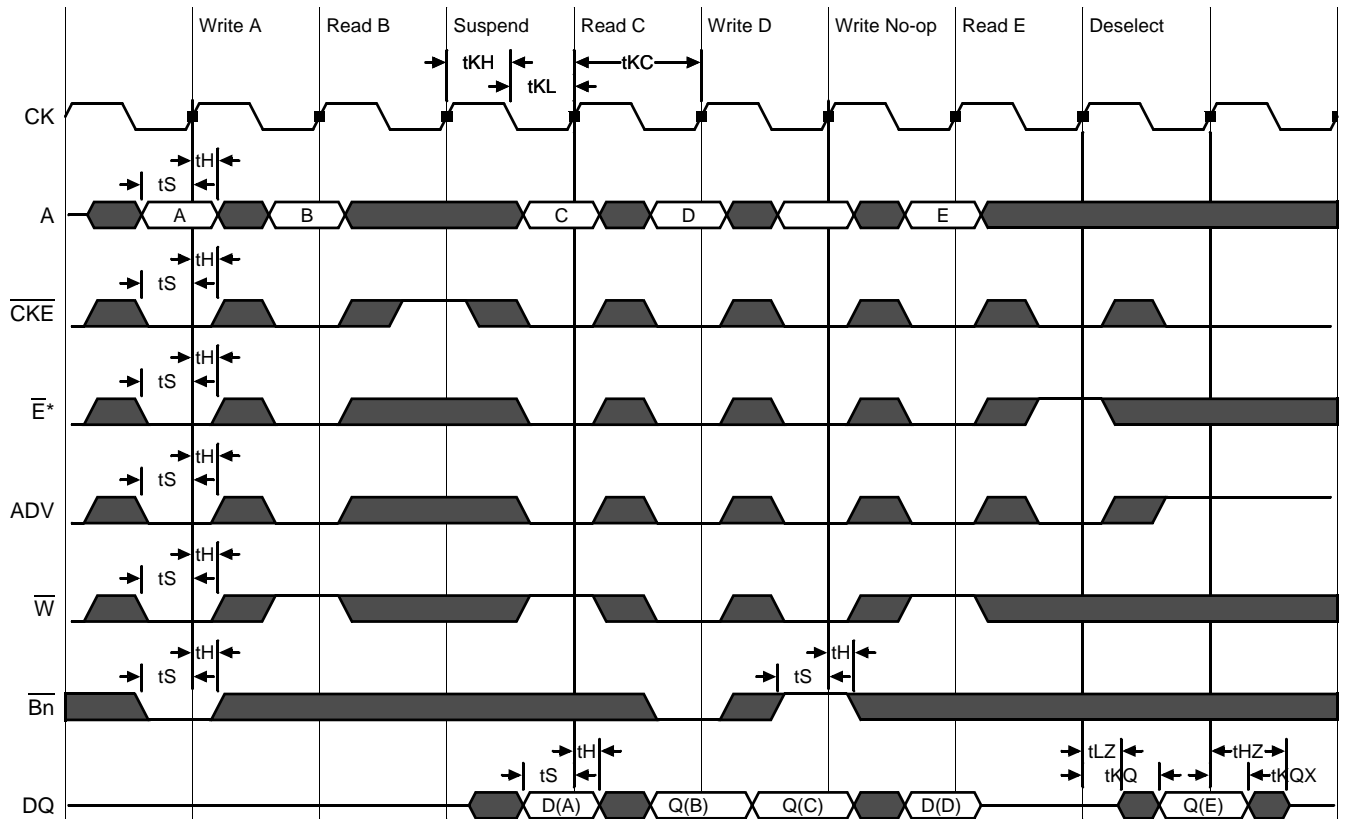

## AC Electrical Characteristics

	Parameter	Symbol	-250		-200		-150		Unit
			Min	Max	Min	Max	Min	Max	
Pipeline	Clock Cycle Time	t <sub>KC</sub>	4.0	—	5.0	—	6.7	—	ns
	Clock to Output Valid	t <sub>KQ</sub>	—	3.0	—	3.0	—	3.8	ns

	$\bar{G}$ to output in High-Z	t <sub>oHZ</sub> <sup>1</sup>	—	2.5	—	3.0	—	3.0	ns
	ZZ setup time	t <sub>ZZS</sub> <sup>2</sup>	5	—	5	—	5	—	ns
	ZZ hold time	t <sub>ZZH</sub> <sup>2</sup>	1	—	1	—	1	—	ns
	ZZ recovery	t <sub>ZZR</sub>	20	—	20	—	20	—	ns

## Notes:

1. These parameters are sampled and are not 100% tested.
2. ZZ is an asynchronous signal. However, in order to be recognized on any given clock cycle, ZZ must meet the specified setup and hold times as specified above.

## Pipeline Mode Timing (NBT)

## Flow Through Mode Timing (NBT)

\*Note:  $\bar{E}$  = High(False) if  $\bar{E}1 = 1$  or  $\bar{E}2 = 0$  or  $\bar{E}3 = 1$

## TQFP Package Drawing (Package T)

Symbol	Description	Min.	Nom.	Max
A1	Standoff	0.05	0.10	0.15
A2	Body Thickness	1.35	1.40	1.45
b	Lead Width	0.20	0.30	0.40
c	Lead Thickness	0.09	—	0.20
D	Terminal Dimension	21.9	22.0	22.1
D1	Package Body	19.9	20.0	20.1
E	Terminal Dimension	15.9	16.0	16.1
E1	Package Body	13.9	14.0	14.1
e	Lead Pitch	—	0.65	—
L	Foot Length	0.45	0.60	0.75
L1	Lead Length	—	1.00	—
Y	Coplanarity			0.10
$\theta$	Lead Angle	0°	—	7°

**Notes:**

1. All dimensions are in millimeters (mm).
2. Package width and length do not include mold protrusion.

## Ordering Information—GSI NBT Synchronous SRAM

Org	Part Number <sup>1</sup>	Type	Voltage Option	Package	Speed <sup>2</sup> (MHz/ns)	T <sub>A</sub> <sup>3</sup>
512K x 18	GS880Z18CT-250V	NBT	1.8 V or 2.5 V	TQFP	250/5.5	C
512K x 18	GS880Z18CT-200V	NBT	1.8 V or 2.5 V	TQFP	200/6.5	C
512K x 18	GS880Z18CT-150V	NBT	1.8 V or 2.5 V	TQFP	150/7.5	C
256K x 32	GS880Z32CT-250V	NBT	1.8 V or 2.5 V	TQFP	250/5.5	C
256K x 32	GS880Z32CT-200V	NBT	1.8 V or 2.5 V	TQFP	200/6.5	C
256K x 32	GS880Z32CT-150V	NBT	1.8 V or 2.5 V	TQFP	150/7.5	C
256K x 36	GS880Z36CT-250V	NBT	1.8 V or 2.5 V	TQFP	250/5.5	C
256K x 36	GS880Z36CT-200V	NBT	1.8 V or 2.5 V	TQFP	200/6.5	C
256K x 36	GS880Z36CT-150V	NBT	1.8 V or 2.5 V	TQFP	150/7.5	C
512K x 18	GS880Z18CGT-250V	NBT	1.8 V or 2.5 V	RoHS-compliant TQFP	250/5.5	C
512K x 18	GS880Z18CGT-200V	NBT	1.8 V or 2.5 V	RoHS-compliant TQFP	200/6.5	C
512K x 18	GS880Z18CGT-150V	NBT	1.8 V or 2.5 V	RoHS-compliant TQFP	150/7.5	C
256K x 32	GS880Z32CGT-250V	NBT	1.8 V or 2.5 V	RoHS-compliant TQFP	250/5.5	C
256K x 32	GS880Z32CGT-200V	NBT	1.8 V or 2.5 V	RoHS-compliant TQFP	200/6.5	C
256K x 32	GS880Z32CGT-150V	NBT	1.8 V or 2.5 V	RoHS-compliant TQFP	150/7.5	C
256K x 36	GS880Z36CGT-250V	NBT	1.8 V or 2.5 V	RoHS-compliant TQFP	250/5.5	C
256K x 36	GS880Z36CGT-200V	NBT	1.8 V or 2.5 V	RoHS-compliant TQFP	200/6.5	C
256K x 36	GS880Z36CGT-150V	NBT	1.8 V or 2.5 V	RoHS-compliant TQFP	150/7.5	C

## Notes:

1. Customers requiring delivery in Tape and Reel should add the character "T" to the end of the part number. Example: GS880Z18CT-150VT.
2. The speed column indicates the cycle frequency (MHz) of the device in Pipeline mode and the latency (ns) in Flow Through mode. Each device is Pipeline/Flow Through mode-selectable by the user.
3. C = Commercial Temperature Range.
4. GSI offers other versions this type of device in many different configurations and with a variety of different features, only some of which are covered in this data sheet. See the GSI Technology web site ([www.gsitechnology.com](http://www.gsitechnology.com)) for a complete listing of current offerings
