# 1 About This Manual

## 1.1 Manual Content

The Gowin UART Master and Slave User Guide mainly includes function introduction, signal definition, working principle, GUI call, etc., which are designed to help users quickly understand the features and usage of Gowin UART Master IP and Slave reference design.

## 1.2 Applicable Products

The information described in this manual applies to the following products:

- GW1N series of FPGA products: GW1N-1, GW1N-1S, GW1N-2, GW1N-2B, GW1N-4, GW1N-4B, GW1N-6, GW1N-9
- GW1NR series of FPGA products: GW1NR-4, GW1NR-4B, GW1NR-9
- GW1NS series of FPGA products: GW1NS-2, GW1NS-2C
- GW1NSR series of FPGA products: GW1NSR-2, GW1NSR-2C
- GW1NZ series of FPGA products: GW1NZ-1
- GW2A series of FPGA products: GW2A-18, GW2A-55
- GW2AR series of FPGA products: GW2AR-18

## 1.3 Related Documents

# 2Function Introduction

## 2.1 Overview

The Universal Asynchronous Receiver/Transmitter, commonly referred to as the UART, is an asynchronous transceiver.

Gowin UART Master IP is a UART Master controller with synchronous SRAM interface, and the external connection standard RS-232 interface. Data is converted between serial communication and parallel communication.

The Gowin UART Slave reference design has the function of receiving and transmitting data, and is mainly used to communicate with the UART Master.

## 2.2 Features

### 2.2.1 Gowin UART Master IP

- Support 5-bit, 6-bit, 7-bit or 8-bit data bits;
- Support odd parity, even parity or no parity;
- Support 1 stop bit, 1.5 stop bit or 2 stop bits;
- Built-in baud rate generator;
- With modem control
- A transmit and receive FIFO with a depth of 16 bytes.

### 2.2.2 Gowin UART Slave Reference Design

With sending and receiving functions;

- Support 5-bit, 6-bit, 7-bit or 8-bit data bits;
- Support odd parity, even parity or no parity;
- Support 1 stop bit, 1.5 stop bit or 2 stop bits.

# 3 Signal Definition

## 3.1 Gowin UART Master IP

### 3.1.1 SRAM Interface Signal

Table3-1 SRAM Interface Signal Definition

No.	Signal name	I/O	Description	Remarks
1	I_CLK	I	Working clock, rising edge sampling	-
2	I_RESETN	I	Reset signal	-
3	I_TX_EN	I	Write enable signal	SRAM write address channel signal
4	I_WADDR	I	Write data signal	
5	I_WDATA	O	Write address preparation	RSAM read address channel signal
6	I_RX_EN	I	Read enable signal	
7	I_RADDR	I	Read address signal	
8	O_RDATA	O	Read data signal	

### 3.1.2 UART Side Signal

Table3-2 UART Side Signal Definition

No.	Signal name	I/O	Description	Remarks
1	SIN	I	Serial data input	-
2	RxRDYn	O	Ready to receive	-
3	SOUT	O	Serial data output	-
4	TxRDYn	O	Ready to send	-
5	DDIS	O	Disable driver	-
6	INTR	O	Interrupt signal	-
7	DCDn	I	Data carrier detection, low effective	Modem interface
8	CTS <sub>n</sub>	I	Run send, low effective	
9	DSR <sub>n</sub>	I	Data communication equipment is ready, low effective	
10	RIn	I	Ringing prompt, low effective	
11	DTR <sub>n</sub>	O	Data terminal is ready, low effective	

No.	Signal name	I/O	Description	Remarks
12	RTSn	O	Request to send, low effective	

## 3.2 Gowin UART Slave

**Table3-3 UART Slave Signal Definition**

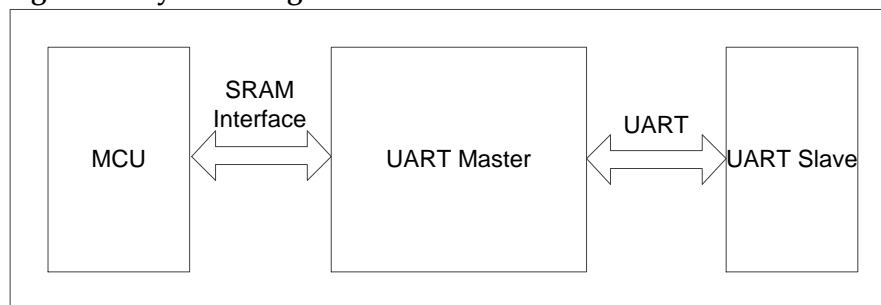

No.	Signal name	I/O	Description	Remarks
1	SCLK	I	Clock signal	-
2	RSTN	I	Reset signal	-
3	TXD	O	Serial output signal	-
4	RXD	I	Serial input signal	-

# 4Working Principle

## 4.1 System Diagram

The UART Master IP acts as a "bridge." The main controller transmits the command or data to the UART Master IP through synchronous SRAM interface, and then the UART Master IP is sent to the UART Slave through the UART; or uploads the UART Slave data to the main controller through synchronous SRAM interface shown in Figure 4-1.

Figure 4-1 System Diagram

## 4.2 Gowin UART Master IP Register

Gowin UART Master IP has 8 registers:

- Receive Buffer Register (RBR)
- Transmit Holding Register (THR)
- Interrupt Enable Register (IER)
- Interrupt Identification Register (IIR)
- Line Control Register (LCR)
- Modem Control Register (MCR)
- Line Status Register (LSR)
- Modem Status Register (MSR)

**Note!**

The receive buffer register (RBR) and the transmit hold register (THR) have the same address, both of which are 0x00.

**Table4-1 Gowin UART Master IP Register**

Register name	Register address	Register bit width	Types	Description
RBR	0x00	8	read	Receive Buffer Register
THR	0x00	8	write	Transmit Holding Register
IER	0x01	8	write	Interrupt Enable Register
IIR	0x02	8	read	Interrupt Identification Register
LCR	0x03	7	write	Line Control Register
MCR	0x04	8	write	Modem Control Register
LSR	0x05	7	read	Line State Register
MSR	0x06	8	read	Modem Status Register

### 4.2.1 Receive Buffer Register (RBR)

The receive buffer register is shown in Figure4-2. The specific bit definition of the register is shown in Table4-2.

**Figure4-2 Receive Buffer Register**

31	8	7	0
Reserved		RBR	

**Table4-2 Receive Buffer Register Bit Definition**

Bit	Name	Defaults	Access type	Description
31:8	Reserved	N/A	N/A	Reserved
7:0	RBR	0x0	read	Cache the last received byte

### 4.2.2 Transmit Holding Register (THR)

The transmit holding register is shown in Figure4-3. The transmit holding register contains the data to be sent next time. The specific bit definitions are shown in Table4-3.

**Figure4-3 Transmit Holding Register**

31	8	7	0
Reserved		THR	

**Table4-3 Transmit Holding Register Bit Definitions**

Bit	Name	Defaults	Access type	Description
31:8	Reserved	N/A	N/A	Reserved
7:0	THR	0x0	write	Keep the last sent byte

### 4.2.3 Interrupt Enable Register (IER)

The interrupt enable register is shown in Figure4-4. The interrupt enable register contains the bits that make the interrupt valid. The bit definition is shown in Table4-4.

**Figure4-4 Interrupt Enable Register**

31	8	7	4	3	2	1	0
Reserved		0000		MSI	RLSI	THRI	RHRI

**Table4-4 Interrupt Enable Register Bit Definition**

Bit	Name	Defaults	Access type	Description
31	4	Reserved	N/A	Reserved
3	MSI	0x0	write	Modem status interrupt enable <ul style="list-style-type: none"> <li>● 0: Disable Modem status interrupt</li> <li>● 1: Enable Modem status interrupt</li> </ul>
2	RLSI	0x0	write	Receive line status interrupt enable <ul style="list-style-type: none"> <li>● 0: Disable receive line status interrupt</li> <li>● 1: Enable Receive Line Status Interrupt</li> </ul>
1	THRI	0x0	write	Transmit Holding Register Empty Interrupt Enable <ul style="list-style-type: none"> <li>● 0: Disable transmit hold register empty interrupt</li> <li>● 1: Enable transmit hold register empty interrupt</li> </ul>
0	RBRI	0x0	write	Receive data valid interrupt enable <ul style="list-style-type: none"> <li>● 0: Disable receive data valid interrupt</li> <li>● 1: Enable receive data valid interrupt</li> </ul>

## 4.2.4 Interrupt Identification Register (IIR)

The interrupt identification register is shown in Figure4-5. The interrupt identifier register contains the priority of the interrupt identifier. The bit definition is shown in Table4-5.

**Figure4-5 Interrupt Identification Register**

31	8	7	4	3	2	1	0
Reserved		0000		INT2	INT1	INT0	INT STAT

**Table4-5 Interrupt Identification Register Bit Definition**

Bit	Name	Defaults	Access type	Description
31:4	Reserved	N/A	N/A	Reserved
3	INT2	0x0	read	FIFO enable <ul style="list-style-type: none"> <li>● 0:16450 mode</li> <li>● 1:16550 mode</li> </ul>
2	INT1	0x0	read	Interrupt identifier <ul style="list-style-type: none"> <li>● 11: Receive line status (highest priority)</li> <li>● 10: Receive data available (Level 2)</li> <li>● 01: Send Hold Register Empty (Level 3)</li> <li>● 00: Modem status (Level 4)</li> </ul>
1	INT0			
0	INT STAT	0x1	read	0: Interrupt waiting

Bit	Name	Defaults	Access type	Description
				1: No interruption waiting

## 4.2.5 Line Control Register (LCR)

The line control register is shown in Figure4-6. The line control register contains the serial communication configuration bits as defined in Table4-6.

Figure4-6 Line Control Register

31	7	6	5	4	3	2	1	0
Reserved		SB	SP	EPS	EPN	STB	WLS	

Table4-6 Line Control Register

Bit	Name	Defaults	Access type	Description
31:7	Reserved	N/A	write	Reserved
6	SB	0x0	write	Setup interruption <ul style="list-style-type: none"> <li>● 1: Start interrupt</li> <li>● 0: Disable interrupt</li> </ul>
5	SP	0x0	write	Forced parity <ul style="list-style-type: none"> <li>● 1: When the 3, 4 bits are logic 1, the parity bit is transmitted and forced to logic 0; When bit 4 is logic 0 and bit 3 is logic 1, the parity bit is transmitted and forced to logic 1</li> <li>● 0: Disable forced parity</li> </ul>
4	EPS	0x0	write	Check selection <ul style="list-style-type: none"> <li>● 1: Select even parity</li> <li>● 0: Select odd parity</li> </ul>
3	PEN	0x0	write	Parity enable <ul style="list-style-type: none"> <li>● 1: Enable parity</li> <li>● 0: Disable parity</li> </ul>
2	STB	0x0	write	Number of stop bits <ul style="list-style-type: none"> <li>● 0: 1 stop bit</li> <li>● 1: 2 stop bits, select 1.5 stop bits when transferring 5 data bits. The reception only detects one stop bit and does not care about the number of selected stop bits.</li> </ul>
1:0	WLS	0x0	write	Byte length selection <ul style="list-style-type: none"> <li>● 00: 5-bit data</li> <li>● 01: 6-bit data</li> <li>● 10: 7-bit data</li> <li>● 11: 8-bit data</li> </ul>

## 4.2.6 Modem Control Register (MCR)

The modem control register is shown in Figure4-7. The modem control register contains the modem signal configuration bits. The bit definitions are shown in Table4-7.

Figure4-7 Modem Control Register

31	8	7	2	1	0
Reserved		000000		RTS	DTR

Table4-7 Modem Control Register

Bit	Name	Defaults	Access type	Description
31:8	Reserved	N/A	N/A	Reserved
7:2	N/A	0x0	write	Always "000000"

Bit	Name	Defaults	Access type	Description
1	RTS	0x0	write	Request to send <ul style="list-style-type: none"> <li>● 1: Drive RTSn signal is low</li> <li>● 0: Drive RTSn signal is high</li> </ul>
0	DTR	0x0	write	The data terminal is ready <ul style="list-style-type: none"> <li>● 1: Drive DTRn signal is low</li> <li>● 0: Drive DTRn signal is high</li> </ul>

## 4.2.7 Line Status Register (LSR)

The line status register is shown in Figure4-8. The line status register contains the current transmit and receive status. The bit definitions are shown in Table4-8.

Figure4-8 Line Status Register

31	7	6	5	4	3	2	1	0
Reserved		TEMT	THRE	BI	FE	PE	OE	RxRDY

Table4-8 Line Status Register

Bit	Name	Defaults	Access type	Description
31:7	Reserved	N/A	N/A	Reserved
6	TEMT	0x1	read	Send empty <ul style="list-style-type: none"> <li>● 0: THR or Transmit Shift Register contains data</li> <li>● 1: THR or Transmit Shift Register is empty. In FIFO mode, both transmit FIFO and shift register are empty.</li> </ul>
5	THRE	0x1	read	Transmit Holding Register (THR) is <ul style="list-style-type: none"> <li>● 0: THR or FIFO has data to send</li> <li>● 1: THR is empty. In FIFO mode, the transmit FIFO is empty.</li> </ul>
4	BI	0x0	read	Break Interrupt. Set this interrupt when SIN is held low for the entire data transfer (start bit + data bit + parity + stop bit)
3	FE	0x0	read	Frame error. The transmission loses a stop bit. After the frame error, the UART assumes that the frame error is caused by the start bit of the next transmission. Try to resynchronize by sampling the start bit twice and receiving the next data.
2	PE	0x0	read	Parity error

Bit	Name	Defaults	Access type	Description
				It means that the received data does not have the correct even or odd number, which is inconsistent with the setting by the check selection bit.
1	OE	0x0	read	Overflow error The RBR was not read before the next data reception, thus destroying the previous data. In FIFO mode, the overflow error is sent as the FIFO is full, and the receive shift register has completed the next data reception.
0	RxRDY	0x0	read	Data is ready <ul style="list-style-type: none"> <li>● 0: All RBR and FIFO have been read</li> <li>● 1: The data has been received and transferred to the RBR FIFO</li> </ul>

## 4.2.8 Modem Status Register (MSR)

The modem status register is shown in Figure4-9. The modem status register contains the status of the current modem interface. The bit definitions are shown in Table4-9.

**Figure4-9 Modem Status Register**

31	8	7	6	5	4	3	2	1	0
Reserved		DCD	RI	DSR	CTS	DDCD	TERI	DDSR	DCTS

**Table4-9 Modem Status Register**

Bit	Name	Defaults	Access type	Description
31:8	Reserved	N/A	N/A	Reserved
7	DCD	X	Read/write	Data carrier detection (low effective) 0: The data carrier has been detected by the modem or data device.
6	RI	X	Read/write	Ringing prompt
5	DSR	X	Read/write	Data communication equipment is ready (low effective) 0: The modem or data device is ready to establish a connection with the UART
4	CTS	X	Read/write	Allow to send (low effective) 0: Modem or data device is ready to exchange data
3	DDCD	0x0	Read/write	Delta Data Carrier Detect. Change in DCDN after last MSR read.
2	TERI	0x0	Read/write	Trailing Edge Ring Indicator. RIN has changed from a low to

Bit	Name	Defaults	Access type	Description
				a High.
1	DDSR	0x0	Read/write	Delta Data Set Ready. Change in DSRN after last MSR read.
0	DCTS	0x0	Read/write	Delta Clear To Send. Change in CTSN after last MSR read.

**Note!**

The default value is X: indicates that this bit is driven by an external input signal.

### 4.3 Gowin UART Slave Implementation

Figure4-10 UART Slave Implementation Block Diagram

The UART Slave reference design mainly includes a data receiving module and a data transmitting module. The data receiving module is configured to receive the serial data sent by the Master and convert it into parallel data transmission to the data sending module. The data sending module receives the parallel data sent by the data receiving module and converts it into serial data for transmission to the Master.

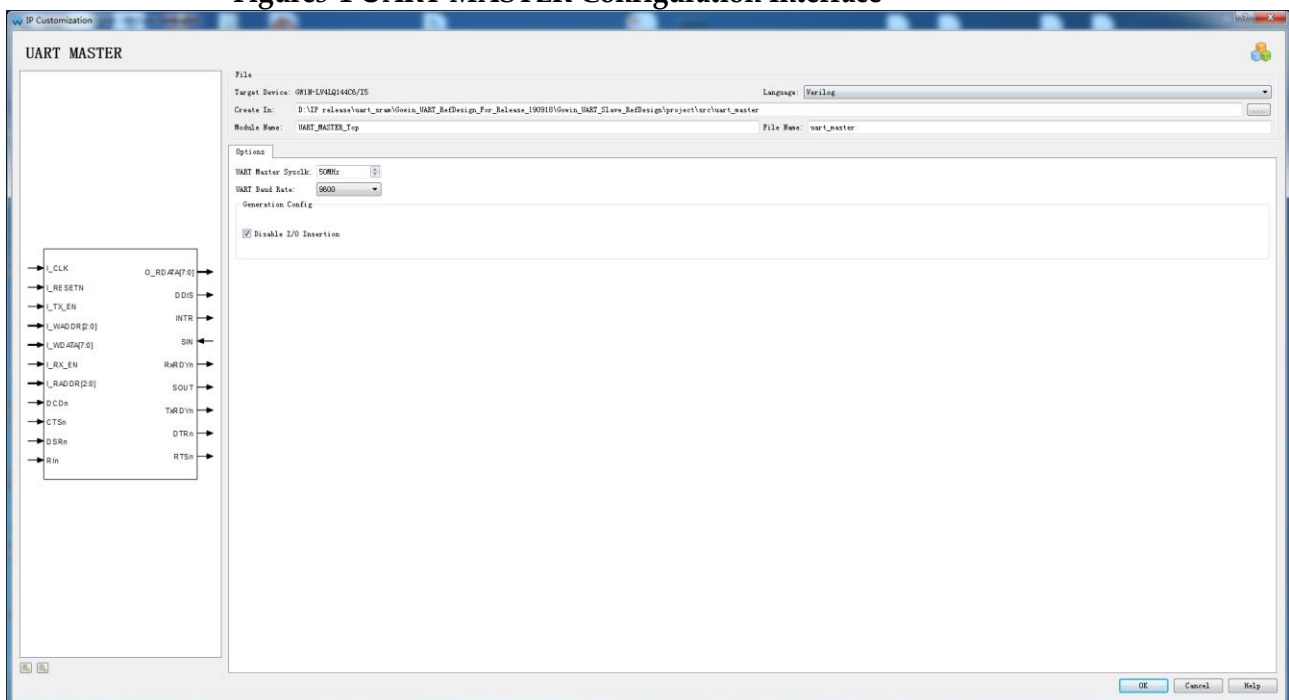

Parameter definitions are used to set the system clock frequency, baud rate, and data frame format.

# 5 Interface Configuration

Users can use the IP core generator tool in the IDE to call and configure Gowin UART MASTER IP.

## 5.1 UART MASTER IP Core Interface

UART MASTER configuration interface is as shown in Figure5-1.  
**Figure5-1 UART MASTER Configuration Interface**

## 5.2 UART SLAVE Reference Design Project

Open Gowin YunYuan software, click “File > Open” to open the “Open File” dialog box, select the project file (\*.gprj), and then open the project, as shown in Figure5-2.

There are three methods to open the project. Please refer to [\*SUG100, Gowin YunYuan Software User Guide > 5 Operation > Open an Existing Project.\*](#)

Figure5-2 Open UART SLAVE Project

## 5.3 Bitstream File Generation

Under necessary constraints, bitstream file can be generated after synthesis, placement and routing. Download the bitstream file to the development board or test board via Gowin USB cable. Observe the communication via the test interface.

# 6 Reference Design

For more details, please refer to the UART reference design at Gowin official website.
