

**Data Sheet**

**Description**

The HEDS-973X is a high performance incremental encoder module. When operated in conjunction with either a codewheel or codestrip, this module detects rotary or linear position. The encoder consists of a lensed LED source and a detector IC enclosed in a small C-shaped plastic package. Due to a highly collimated light source and a unique photodetector array, the module is extremely tolerant to mounting misalignment.

The two channel digital outputs and 3.3V supply input are accessed through four solder plated leads located on 2.54mm (0.1inch) centers.

The standard HEDS-973X is designed for use with an appropriate optical radius codewheel or linear codestrip. Other options are available. Please contact the factory for more information.

**Features**

- Small Size
- High Resolution
- Two Channel Quadrature Output
- Linear and Rotary Applications
- No Signal Adjustment required
- TTL or 3.3V/5V CMOS Compatible
- Wave Solderable
- Lead-free Package
- -40°C to 85°C Operating Temperature
- Single 3.3V Supply

**Applications**

The HEDS-973X provides sophisticated motion detection, making closed loop control very cost competitive. Typical applications include printers, plotters, copiers and office automation equipment.

Note:

Avago Technologies' encoders are not recommended for use in safety critical applications, e.g., ABS braking systems and critical-care medical equipment. Please contact a sales representative if more clarification is needed.

ESD WARNING: NORMAL HANDLING PRECAUTIONS SHOULD BE TAKEN TO AVOID STATIC DISCHARGE.

## Theory of Operation

A HEDS-973X is a C-shaped emitter/detector module. Coupled with a codewheel, it translates rotary motion into a two-channel digital output; coupled with a codestrip, it translates linear motion into digital outputs.

As seen in Figure 1, the module contains a single Light Emitting Diode (LED) as its light source. The light is collimated into parallel beam by means of a single lens located directly over the LED. Opposite the emitter is the integrated detector circuit. This IC consists of photodetectors and a signal processing circuitry necessary to produce the digital waveforms.

The codewheel/codestrip moves between the emitter and detector, causing the light beam to be interrupted by the pattern of spaces and bars on the codewheel/codestrip. The photodiodes, which detect these interruptions, are arranged in a pattern that corresponds to the radius and count density of the codewheel/ codestrip. These photodiodes are also spaced such that a light period on one pair of detectors corresponds to a dark period on the adjacent pairs of detectors. The photodiode outputs are fed through the signal processing circuitry. Two comparators receive these signal and produce the final outputs for Channels A and B. Due to this integrated phasing technique the output of channel A is in quadrature with Channel B (90 degrees out of phase).

## Output Waveforms

Figure 2.

## Definitions

Note: Refer to Figure 2

**Count (N):** The number of bar and window pairs or counts per revolution (CPR) of the codewheel. Or the number of lines per inch of the codestrip (LPI)

$$1 \text{ shaft Rotation} = 360 \text{ degrees} \\ = N \text{ cycles}$$

1 cycle (c) = 360 electrical degree, equivalent to 1 bar and window pair.

**Pulse Width (P):** The number of electrical degrees that an output is high during one cycle, nominally  $180^\circ$ e or  $1/2$  a cycle.

**Pulse Width Error ( $\Delta P$ ):** The deviation in electrical degrees of the pulse width from its ideal value of  $180^\circ$ e.

**State Width (S):** The number of electrical degrees between a transition in the output of channel A and the neighboring transition in the output of channel B. There are 4 states per cycle, each nominally  $90^\circ$ e.

**State Width Error ( $\Delta S$ ):** The deviation in electrical degrees of each state width from its ideal value of  $90^\circ$ e.

**Phase ( $\phi$ ):** The number of electrical degrees between the center of the high state on channel A and the center of the high state on channel B. This value is nominally  $90^\circ$ e for quadrature output.

**Phase Error ( $\Delta\phi$ ):** The deviation in electrical degrees of the phase from its ideal value of  $90^\circ$ e.

**Direction of Rotation:** When the codewheel rotates in the counter-clockwise direction (as viewed from the encoder end of the motor), channel A will lead channel B. If the codewheel rotates in the clockwise direction, channel B will lead channel A.

**Optical Radius ( $R_{op}$ ):** The distance from the codewheel's center of rotation to the optical center ( $O^\circ C$ ) of the encoder module.

**Angular Misalignment Error ( $E_A$ ):** Angular misalignment of the sensor in relation to then tangential direction. This applies for both rotary and linear motion.

**Mounting Position ( $R_M$ ):** Distance from Motor Shaft center of rotation to center of Alignment Tab receiving hole.

## Absolute Maximum Ratings

Parameter	Symbol	Min.	Max.	Units	Notes
Storage Temperature	$T_S$	-40	85	°C	
Operating Temperature	$T_A$	-40	85	°C	
Supply Voltage	$V_{CC}$	-0.5	7	Volts	
Output Voltage	$V_O$	-0.5	$V_{CC}$	Volts	
Output Current per Channel	$I_{OUT}$	-1.5	19	mA	
Soldering Temperature	$T_{SOL}$	20	260	°C	t* 5 sec

## Recommended Operating Conditions

Parameter	Symbol	Min.	Typ.	Max.	Units	Notes
Temperature	$T_A$	-40		85	°C	
Supply Voltage	$V_{CC}$	2.8	3.3 or 5	5.2	Volts	Ripple < 100mVp-p
Load Capacitance	$C_L$			100	pF	
Pull-up Resistor	$R_L$		none			Recommend no pullup. Device has integrated 2.5 k $\Omega$ on outputs
Frequency	f			40	kHz	Velocity (rpm) x N/60
Angular Misalignment	$E_A$	-2.0	0.0	+2.0	Deg.	Refer to Mounting Consideration
Mounting Position	$R_M$		ROP-0.14 (ROP -0.006)		Mm (inch)	Refer to Mounting Consideration

## Electrical Characteristics

Electrical Characteristics Over the Recommended Operating Conditions. Typical Values at 25°C.

Parameter	Symbol	Min.	Typ.	Max.	Units	Notes
Supply Current	$I_{CC}$	12	25 55	40 85	mA	Typ. 3.3V Typ. 5V
High Level Output Voltage	$V_{OH}$	2.4			Volts	When $V_{OH} = 2.4V$ (Min)Typ. $I_{OH} = -0.4$ mA @ 3.3VTyp. $I_{OH} = -1.0$ mA @ 5V
Low Level Output Voltage	$V_{OL}$			0.4	Volts	When $V_{OL} = 0.4V$ (Max)Typ. $I_{OL} = 12$ mA @ 3.3VTyp. $I_{OL} = 14$ mA @ 5V
Rise Time	$t_r$		200		ns	$C_L = 25$ pF
Fall Time	$t_f$		50		ns	

## Encoding Characteristics

Encoding Characteristics Over the Recommended Operating Conditions and Mounting Conditions These characteristics do not include codewheel/codestrip contribution. The typical values are average over the full rotation of the codewheel

Parameter	Symbol	Typical	Maximum	Units	Notes
Pulse Width Error	$\Delta P$	5	50	°e	
State Width Error	$\Delta S$	3	50	°e	
Phase Error	$\Delta \phi$	2	15	°e	

## Mounting Considerations

Note: These dimensions include shaft end play and codewheel warp.

For both rotary and linear motion, angular misalignment, EA must be  $\pm 1$  degrees to achieve Encoding Characteristics.

All dimension for mounting the module and codewheel/codestrip should be measured with respect to two mounting posts, as shown above

## Recommended Codewheel and Codestrip Characteristics

Parameter	Symbol	Min.	Max.	Unit	Notes
Window/bar Ratio	Ww/Wb	0.9	1.1		
Window Length (Rotary)	LW	1.80 (0.071)	2.31 (0.091)	mm (inch)	
Absolute Maximum Codewheel Radius (Rotary)	Rc		Rop + 3.40 (Rop + 0.134)	mm (inch)	Includes eccentricity errors
Center of Post to Inside Edge of Window	W1	1.04 (0.041)		mm (inch)	
Center of Post to Outside Edge of Window	W2	0.76 (0.036)		mm (inch)	
Center of Post to Inside Edge of Codestrip	L		3.60 (0.142)	mm (inch)	

## Ordering Information

HEDS - 973  Option

**Lead Configurations**  
 0 - Straight leads  
 1 - Bent leads

**Resolution**  
 3 - 480 LPI

**Bracket Option**  
 50

## Package Dimension

### Option 50

LEAD THICKNESS = 0.25 mm  
 LEAD PITCH = 2.54 mm

### Bent Version - Option 50

LEAD THICKNESS = 0.25 mm  
 LEAD PITCH = 2.54 mm
